Armstrong offers the widest choice in resilient floors. The best is the one that suits your design.

HERE, THE BEST IS EMBOSSED EXCELRON TILE.

The architects of this new Maryland bank chose Embossed Excelon. For three reasons:

1. They wanted a floor with a rich, classic look. The Travertine design in Embossed Excelon gave them just what they were looking for—plus perfect color-coordination with the rest of the Carroll County Bank's distinctive and dramatic interior.

2. They wanted a floor that would be easy to keep beautiful. This one is. Its special graining helps hide dirt and scuff marks between cleanings.

3. They wanted a rich-looking but relatively inexpensive floor. Embossed Excelon is luxurious in appearance, but it's low-cost vinyl-asbestos.

Which resilient floor best meets your special need? Check with your Armstrong Architect-Builder-Contractor Representative. He's a flooring expert. And because Armstrong offers the widest choice in resilient flooring, he's well equipped to give you the objective advice you're looking for. Call your Armstrong A-B-C Representative or write Armstrong, 511 Rock Street, Lancaster, Pennsylvania.

Excelon is a registered trademark of the Armstrong Cork Company.

ARCHITECTURE FOR BUSINESS

Not only are there more opportunities these days for architects to design office buildings—with still more in store, according to the F. W. Dodge prognostications for 1966 (see pages 121–128)—but more office buildings of high design quality are resulting. Or so it would appear from the intensive review of new office buildings undertaken for next month's Building Types Study on office buildings: an impressive indication of the kind of contribution architecture can make to commerce.

GUIDE FOR PUBLICATION RESEARCH

The twice-yearly aid to readers who remember-having-seen-but-can’t-remember-when, or who are checking recent publications on a particular building type or a particular architectural or engineering subject, the Record's semi-annual index, will be published in the December issue. (The index to the first seven issues of 1965—including Mid-May—was published in the June issue.)

OFFICERS OF MCGRAW-HILL PUBLICATIONS: Sheldon Fisher, president; vice presidents: Robert F. Marshall, operations; Robert F. Boger, administration; John R. Calabash, editorial; Ervin E. DeGraff, circulation; Donald C. McGraw, Jr., advertising sales; Angelo R. Venezian, marketing.

Every effort will be made to return material submitted for possible publication (if accompanied by stamped, addressed envelope), but the editors and the corporation will not be responsible for loss or damage.

SUBSCRIPTIONS: Available only by paid subscription. Publisher reserves the right to refuse non-qualified subscriptions. Subscriptions solicited only from architects and engineers. Position, firm connection, and type of firm must be indicated on subscription orders forwarded to Fulfillment Manager, Architectural Record, P.O. Box 430, Hightstown, New Jersey 08520. Subscription prices: U.S., Possessions and Canada: $5.50 per year; other Western Hemisphere countries, to those who by title are architects and engineers, $12.50 per year. Single copy price, $2.50. Beyond Western Hemisphere, to those who by title are architects and engineers, $12.50 per year for 12 monthly issues not including Mid-May issue. Subscriptions from all others outside U.S., U.S. Possessions and Canada for 12 monthly issues, not including Mid-May issue, $24 per year.

SUBSCRIBERS: Address change of address notice, correspondence regarding subscription service or subscription orders to Fulfillment Manager, ARCHITECTURAL RECORD, P.O. Box 430, Hightstown, New Jersey 08520. Change of address notices should be sent promptly; provide old as well as new address. Include zip code or postal zone number if any. If possible, attach address label from recent issue. Please allow one month for change of address to become effective.

UNCONDITIONAL GUARANTEE: The publisher, upon written request, agrees to refund the part of the subscription price applying to the remaining unfulfilled portion of the subscription if service is unsatisfactory.

POSTMASTER: Please send Form 3579 to Fulfillment Manager, Architectural Record, P.O. Box 430, Hightstown, New Jersey 08520.
Brick custom design made easy! Single bricks add new variety to Kentile Colonial Brick Solid Vinyl Tile. They can be laid in any custom design, like natural brick. But check the cost savings (including no special underfloor). Colonial Brick's brawny beauty really lasts in both residential and commercial installations. Surprisingly easy to maintain. Samples? Call your Kentile® Representative.
The Houston Post Office is one of the fine public buildings of the modern era. It is handsome. It is practical. It has dignity.

The dominant architectural feature of the building is its finned screen of precast concrete that shields the structure from the heat and glare of the Texas sun.

The screen is white—made of Trinity White Portland Cement with an exposed quartz aggregate. These panels are set out 2'8" from the glass. Contrast between sunlight and shadow, dark glass and white concrete, gives an ever-changing, always-interesting effect.
Proletarianization of Engineering

One tends to think these days of young physicists and engineers as science-fiction heroes. Competing proselyters from industrial organizations can hardly wait for them to graduate from college; they make them attractive offers, not forgetting handsome laboratory quarters in vacation-land locations, with salaries to match. The boys charge out of college, picking up the world's tastiest oysters as they choose. It is difficult to think of disillusionment as their lot.

If, however, you can absorb the idea that they, too (like all other young graduates, including architects) find the world an immovable object, perhaps you can imagine that their come-down is pretty serious. If they fall in disillusionment, they fall from a higher point, or so it would seem.

But they fall. I am told, and they do fall far. According to a professor from Harvard's famous "B School" (business administration), what hits the young engineers, in the great space-age plants, is "proletarianization." The eager youth can't even get off the plane, presumably at his new west coast abode, without seeing mammoth signs with his employers' proclamation, all too apparent, that the outfit is tremendous. All around the city are other evidences of its magnitude. And when he gets to his assigned cubbyhole, he finds a great line of similar cells where other young geniuses are tackling engineering assignments. But the assignments get smaller and meaner and more impersonal. No hero now, just another in a long line of scientific oar-pullers.

According to the professor, the young scientists soon notice that affairs are less impersonal on the administrative floors. The "guys that have it made," it appears, are the "business administration" trainees. And so, said the speaker, 45 per cent of the enrollees at Harvard's "B School" are engineers, or ex-engineers, taking up new studies to get away from the assembly-line dullness of their lives.

Creativeness, a precious asset, is a very tender one. It just could be that our present world—great, growing, changing, wealthy, ever more impersonal—is increasingly discouraging to creative talents. Those creative talents might be the greatest hope for keeping the world livable, and maybe they need thoughtful nurture.

It used to be accepted that young hot shots from the universities needed to be brought down to earth, and their elders made that objective a conscious project.

Maybe it was simply the law of the jungle—the young bulls must be taught to mind their manners. Or maybe, in a modernized, "civilized" world, it is merely poor personnel management. Industrial giants have developed their competitive enlistment procedures, but have not paid enough attention to their husbandry.

What is different today, one might theorize, is that while yesterday's world offered a generally healthful climate for creativeness, today's seems to snow it under. To bury it in what the professor called "proletarianization." Individualism generally is slipping away from us, lost in mere numbers if not in automation.

Or, some say that creative courage, as a national asset, has been weakening for thirty years. The Great Depression, followed by the New Deal, the labor union, progressive education, social security, etc., have raised a generation whose goal is security. Let us not stop now to argue these matters, but merely mark the deteriorating effect on individual inventiveness and enterprise.

I should have to believe that we still have such assets in substantial quantities. The point is that we may have to guard them more consciously than in the past.

Maybe those proletarianized engineers can be supplanted in some degree by computers. Maybe we need their brains and enterprise in business (and political) administration, and they should fight their way out of the sciences. But what is for sure is that the world needs creativeness in science, engineering, architecture, art, and, yes, in cooking. So let's think a little about feeding whatever tender shoots seem to hold promise.

—Emerson Goble

ARCHITECTURAL RECORD November 1965
Mega-structures for Macro-environment

Two very unpleasant words, in the opinion of your humble servant. But one hears them today. Plans are being drawn for some mega-structures, with multi-uses, presumably because the environment is becoming so macro that we must stack things up in new sizes and combinations.

Land values are rising so fast, one is told, that 100-and-more-story buildings are economically justified, especially since land is becoming too valuable to be used for only a part of the day, as might be the case in a single-purpose building. So we have combinations of offices, shopping center, and apartments in the same building, plus, more than likely, a roof, the building, plus, more than likely, a single-purpose building. So we have the day, as might be the case in a valuable to be used for only a part of especially since land is becoming too.

I am afraid I should find myself all out of scale. I could ride to the 100th floor for some business purpose, but I should hate to have a dwelling there. I should have to take the elevator down, every once in a while, to touch the earth, or walk through a puddle. And then I should hate like hell to go back upstairs.

Assembly-Line Houses, Or Here We Go Again

It was around 1942 or 43, I guess, when we heard so much about assembly-line houses. The mass-production system, we were told, could turn out houses so cheaply that the conventional building system was washed up. This was of great social importance, of course, since a third of our nation was ill-housed, and a cheap, mass-produced house was the obvious answer. Such a house, and every family could have one.

I remember that we gave this matter a lot of study, and we, clever fellows that we were, didn't have much trouble figuring out that even if you gave a poor family a newly produced complete house, absolutely free of charge, that family couldn't afford it. There were such little items as land costs, foundations, utility connections, taxes, road assessments, not to mention title investigations and other miscellaneous little matters like heating and operating costs.

The tape is being played again, this time by one Glenn H. Beyer, of Cornell University, billed in a release as a housing researcher. He has trotted out the ill-fated, all-steel Lustron house, as an example of the "total house, rather than its many, individual components." He says that Lustron only needed more time to thrash out its problems.

I seem to remember it had a lot of them, not all within its own control, like the reception of the public.

Yes, I know that prefabrication has made great progress in the intervening years, and that prefab components are increasing in size and importance.

Maybe that old devil the population explosion will put new impetus in prefab acceptance. But assembly-line designs, in assembly-line quantities, on assembly-line lots, is not my own idea of what the world is waiting for. Mr. Beyer is going to find me quite stubborn.

Let's Get Away To the South Seas

A recent report, in The New York Times, of a conference in Lae, New Guinea destroys an old dream of getting away from it all in the South Sea Islands. Those islands are having population troubles and urban congestion, and slums and poverty and crime.

And I suppose that the pretty brown-skinned girls are wearing city clothes now. And that the tourists with cameras are being replaced by business men with dispatch cases. I haven't heard that the Beatles have stopped there yet, but probably their records are lousing up the local discotheques.

I guess we're stuck with those mega-structures in our macro-environment. At least we're stuck with man-made design, for better or worse.
AMWELD SOLVES YOUR HARDWARE PUZZLE!

It's hard to find hardware that won't fit an Amweld steel door . . . because you have an almost unlimited selection of contract builders' hardware when you specify and install famous Amweld doors.

Whether it's for exterior, interior or fire barrier requirements, you are never limited in your hardware selection by an Amweld door . . . regardless of the function of the hardware, or your decorative purposes.

Amweld designs, engineers and builds for the architect . . . the contractor . . . the owner. Amweld says, "Choose your hardware, then specify and install an Amweld door with complete confidence!"

If you don't already know it, every Amweld door is universally handed for your convenience in designing, specifying, purchasing and installing. Trained Amweld distributors in your own locality can give you prompt delivery from their fine local inventory of Amweld steel doors and frames.

For the complete story, send for our new brochure on "Hardware Flexibility." We'll have a copy waiting for you.

ARCHITECTURAL RECORD November 1965 11
flexible gas air conditioning adapts to any building design.

Gas absorption air conditioning doesn't cramp your imagination (or your floor plans). You put it where you want to. On the roof. In the basement. Anywhere! Wherever it best fits your design concept. It works for you...with you...as a dynamic and functional element to enhance, not encumber, your thinking. Easy-going and vibration-free, gas air conditioning doesn't need "quiet zoning." You can work to it...around it...from it. Even tie in existing boilers to make them perform year 'round for you. You'll find gas absorption air conditioning most accommodating...right at home in the climate of creativity.

In East Ohioland, call your East Ohio Architectural Representative for more cool facts and figures. He'll work with you to capitalize on the design flexibility, the practicality, of gas air conditioning.

GAS MAKES THE BIG DIFFERENCE...COSTS LESS, TOO!

An underfloor raceway that stays put

(PORTER "NATIONAL ELECTRIC" TRENCHDUCT SECURELY LOCKS IN PLACE)

Is continual maintenance a costly problem in your underfloor raceway systems? Then let Porter "National Electric" immovable Trenchduct provide absolute stability. Positive, locked-in, Trenchduct immobility is assured with anchored terminal lugs. These lugs become embedded in the concrete fill, keep the duct from shifting. Designed to meet all your raceway requirements . . . Trenchduct offers the most value for the lowest possible cost.

Available in varied widths and depths . . . Trenchduct is also tailor-made engineered for easy installation. Now smooth surface areas are no longer a problem with aluminum trim strip. After the concrete sets, a new trim strip is installed, and a clean, attractive surface area is available for your tile application.

For additional information write for our catalog. Electrical Division, Porter Building, Pittsburgh, Pa. 15219.
It takes only minutes to tell

Here is a case where one of the country's leading architectural firms—I. M. Pei and Associates—specified DEVOE paints for the handsome new Earth Science Center they designed for M.I.T. There is nothing unusual about the paint requirements in either type or color—unless you would consider using top quality paint something unusual. Why, then, was DEVOE the choice?

It's simple: because architects such as I. M. Pei know that DEVOE works with them. DEVOE provides the industry's outstanding service—a local representative, known as the Man from DEVOE. This paint expert lends his assistance on product selection. He gives useful advice on proper surface preparation and on application. He can play a valuable part in color choice. What's more, he understands paint performance, costs and special formulations.

And he's on the job for any on-site supervision needed.

Backing him up, of course, is the convenience of DEVOE's complete line—the right finish for every surface. Plus a network of plants and branches across the country to assure prompt attention and delivery.

It is quite a story, right? To get the full benefits for yourself, call or write our nearest office and talk to your Man from DEVOE.
Why should the world's leading electric plant builder use an outside testing organization?

Onan's block-long testing wing can be geared to a check-out capacity of 9,000 units a month. That's a lot of testing, because every Onan electric plant is run-in under full load for from two to eight hours before it is okayed for shipping.

We rarely have to flunk an Onan generator set because it fails to deliver in the "under load" test bank. Stringent quality control procedures throughout production maintain strict standards for all components.

We doubt that there are more competent or more conscientious employees than Onan testing department personnel.

With all this going for us, we still use J. B. Calia & Associates to double-check our own tests and testing procedures.

As a manufacturer, we like the idea of an independent source periodically checking up on our product performance tests.

Gives us the confidence to say "We certify that when properly installed and operated, every Onan electric plant will deliver the full power and the voltage and frequency regulation promised by its nameplate and published specifications."

Gives you absolute assurance that you get every watt of power you pay for when you choose Onan.

**PERFORMANCE CERTIFIED**

We certify that when properly installed and operated this Onan electric plant will deliver the full power and the voltage and frequency regulation promised by its nameplate and published specifications. This plant has undergone several hours of running-in and testing under realistic load conditions, in accordance with procedures certified by an independent testing laboratory.

ARCHITECTURAL RECORD November 1965 17
LPI HAS A STANDARD LINE OF HEAT REMOVAL TROFFERS THAT CAN HELP YOU PUT "HEAT-WITH-LIGHT" INTO YOUR NEXT JOB

JUST AS IT DID ON THIS ONE.

Latest IES recommended lighting levels of 150 footcandles are provided as part of the integrated heating, cooling, and illuminating system in this building. Separate conventional systems were originally planned, but cost studies led to the adoption of the integrated system using LPI recessed fluorescent lighting and heat-removal fixtures. The savings are significant. Heat generated by the higher footcandle system is used, in the winter, as the primary source of building heat. And, in the summer, the extra heat generated may be vented directly outside, or used in an air conditioning heat exchanger.

The LPI heat removal troffers that make modern systems such as these possible are standard, proven components. They're available in flange or lay-in types, in 4 or 8 feet lengths, for 2 or 4 lamps, and with your choice of lenses. For complete information on these fixtures, and how they can help you put "heat-with-light" into your next jobs, call your LPI representative or write us.

The 990 Grove Street Building, Evanston, Illinois.
Look!...

Beneath the surface beauty is the "Hidden Value" of Southern Pine...

Architects know the importance of quality in framing lumber for integrity of design and security. That is why so many are specifying Southern Pine. Pre-shrunk to full American Lumber Standard sizes, with engineered strength, Southern Pine is rigidly graded under highest standards of the lumber industry. It lets you plan boldly, with assurance of economy in construction and minimum maintenance during years ahead. All-purpose grading permits use of standard grades for trussed rafter, cantilevered or continuous beams without special grading. Southern Pine lumber also lends visible distinction to your designs in many intriguing forms—durable decking, striking patterns of paneling and siding, exquisite trim.

SPECIFY SOUTHERN PINE FROM THE MEMBER MILLS OF THE SOUTHERN PINE ASSOCIATION, P. O. BOX 52468, NEW ORLEANS, LA. 70150.

a specification from Hillyard...

FOR A GYMNASIUM FINISH
that will withstand multiple use

PRODUCT NAME: TROPHY® SEAL & TROPHY® FINISH

DESCRIPTION: A seal and a finish especially formulated for wood gymnasium floors to give a light, durable, slip resistant playing surface that will resist rubber burning and marking.

SPECIFICATION AND HOW TO APPLY: An epoxy seal and finish. Apply with lambswool applicator. Seal coat fills porous wood surface. Game markings, using Hillyard Gym line paint, are painted in before finish coats are applied. Two finish coats are required. See Sweets Arch. File for detailed specification.

COVERAGE (Average): Trophy Seal—350 sq. ft. per gallon. Trophy Finish—500 sq. ft. per gallon.

TECHNICAL DATA: N.V.M.:
Trophy Seal - 28%, Trophy Finish, 40%. Color: Gardner (typical) 4-5 (extremely light). Drying time: 7 hours to overnight (depending on humidity). Produces a glare free surface with proper light refraction. Exceeds all standards for abrasion resistance. Non-darkening—eliminates need for removing or sanding off finish for 10-15 years.

GUARANTEE: Controlled uniformity. When applied according to directions and under supervision of a Hillyard representative, all claims for the product are guaranteed.

MAINTENANCE: Regular treatment with Hillyard Super Hil-Tone dressing for conditioning and dust control.

APPROVALS: Maple Flooring Mfrs. Assn., Institutional Research Council. Listed by Underwriters' Laboratories as “slip resistant” In use: 12 years on all major basketball tournament floors.

Where is the best place for the closer?

1. ON THE DOOR . . .
   Field installation. Economical and faithful — but exposed.

2. IN THE FLOOR . . .
   Field installation. Requires a cement case and a cover plate.

3. IN THE FRAME . . .
   Field installation. Requires a special transom bar or header.

4. IN THE DOOR . . .
   The new IN-A-RALE Closer is factory-installed in the door itself. Model 50-500 Door and Frame

Only Amarlite has ALL FOUR:
Only Amarlite puts the in-a-RALE closer in the door!

Specify IN-A-RALE — a revolutionary new concept in closers that gives you more of what you're looking for:
- This competitively priced unit is the first complete entrance package with a factory-installed closer! The entrance goes in fast and easy. No on-the-job closer installation required!
- It precisely meets architectural specifications
- Closer is invisible . . . and quality features include disappearing arm, adjustable hydraulic back-check, hold-open, shock-absorber, adjustable sweep speed and latching speed.
- Specify IN-A-RALE for your next job . . . it's another EXCLUSIVE from the AMARLITE DIVISION of Anaconda Aluminum Company.

P. O. Box 1719, Atlanta, Georgia 30301.

Meet CLYMATRON II, son of Clymatron. Better than its pa. Puts out more footcandles of cooler light. Better looking, too. Has extruded aluminum trim, regressed splay, frameless or framed enclosures. Besides lighting, Clymatron II handles air...lots more of it in fact, with a new adjustable baffle controlling its direction from vertical to horizontal...transfers heat...even provides total heating. In fact, it does so many things, it takes a brochure to explain the whole story. Better write for it!
Give an eye to NOVI. Brand new recessed fixture for offices, stores, hospitals. Only 3 1/8" deep! Has “regressed splay”… a fancy way of saying the lens is indented. Extruded aluminum trim comes in white (anodized if you desire). Lots of low brightness control. Bigger luminous area with either frameless plastic, aluminum-framed glass or plastic lens. So you see. Ceilings just won’t know what they’re missing… until you specify NOVI!

A new sandwich created for your taste

Union-Camp's new URECOMB core gives you the insulation of rigid Urethane foam plus the strength of Honeycomb—in one lightweight sandwich panel core.

What a combination! Rigid Urethane foam—an outstanding insulator. And Union Honeycomb—incredibly strong and lightweight. Together, they make URECOMB—the most efficient structural sandwich core ever developed.

Amazing strength-weight ratio. The URECOMB core in a typical wall panel (2” thick) has a compression strength of more than 50 lbs. per square inch...yet it may weigh less than ½ a pound per square foot!

Built-in insulation. URECOMB core has good heat resistance and an outstanding coefficient of thermal conductivity. The two pound density of the Urethane in URECOMB has a "K" factor of 0.12...about twice as effective as the next best insulation. This may allow reductions in insulative panel thicknesses of up to 50%.

Flammability. The Urethane used in URECOMB is self-extinguishing. This characteristic of the Urethane foam is desirable in many applications. When sandwich constructions are involved, non-fire retarding foams have been found suitable, since the facings obstruct surface flame spread and prevent air from entering and feeding the flame in the core.

URECOMB insulated panels are easy to handle. Easy to install. Lightweight to ship. They are extremely rigid—ideal for floors, walls, partitions, roofs of varied structures.
Contessa means more than exquisite elegance and superb styling. Behind the restrained, cut-crystal purity of long-lasting clear lucite, is the Price Pfister hallmark of exceptional quality and functional design, meticulously crafted for long years of treasured use. To the contractor, it means consistent savings on installation costs and elimination of unwanted call-backs. This, combined with attractive low cost makes Contessa ideal for any specifications, from tract homes to luxury high-rise dwellings. Contessa, with its accent on elegance, is yet another prestige product of plumbing brass — by Price Pfister.

Will you step into this classroom for a moment, please?

We'd like to call your attention to two things.

One that you can see: our new Carrier Moduline® Ceiling Air Terminals with automatic self-contained temperature control.

And the other you can't: a new kind of air conditioning system Moduline units make possible—the Dual Conduit System.

Classroom walls can be folded back to create a large team teaching area. Yet expansion or contraction of teaching space poses no problems for the Carrier Dual Conduit System because of its inherent modular air distribution and control.

The Dual Conduit System provides Randolph Junior High and other schools with a space-saving all-air system that heats or cools in each module at the command of a built-in thermostat. Operating costs are low because Dual Conduit always "follows the load," taking full advantage of diversity afforded by unoccupied areas.

Moduline units also make possible a very simple variable-volume single duct system. It is ideal for economical automatic temperature control in office buildings and hospitals. Control zones as small as 100 square feet are highly practical. Partitioning modules may be as small as 25 square feet.

We've covered both systems in detail in a brochure that illustrates many attractive ceiling arrangements achieved by architects using Moduline units.

Carrier Air Conditioning Company

More people put their confidence in Carrier air conditioning than in any other make

New Hetron®/Hetrofoam® sandwich panel system helps make four-room modules possible

Hetrofoam-based polyurethane insulation foamed between skins of reinforced Hetron polyester resin and plywood panels forms the exterior walls of this module.

The four-room component is a unit of a 32-room Holiday Inn Jr. motel. Hetrofoam-based foam is almost unlimited in its scope of fabrication. It fills the space around the electrical conduit and roughed-in plumbing in the walls. It shapes itself to the stylized triangular pyramids of the Hetron skin.

Hetron and Hetrofoam lend themselves to large fabrications such as these 8x10 and 8x14 ft. module panels. They are relatively lightweight. They help make handling and assembly easy and help keep shipping costs low when the modules are shipped from plant to erection site. Won't support combustion. Hetrofoam-based polyurethane foam is rated nonburning by ASTM D-1692-59T.

Typical Hetron polyester laminates test within a range of 20 for highly filled panels to 75 for translucent panels in a flame-spread rating by ASTM E-84-50T.

Would big modules help you solve a design problem? There may well be dozens of applications where low-cost, mass-produced modules based on a Hetron/ Hetrofoam sandwich panel system offer a practical solution.

We'll be glad to send you technical data on properties of Hetron and Hetrofoam and give you engineering help on the project you have in mind. Please write Durez® Plastics Division, Hooker Chemical Corporation, 8011 Walck Road, North Tonawanda, N.Y. 14121.
FIREMARK
symbol of fire protection

A SIMPLE, LOW-COST, TWO-COMPONENT SYSTEM*
FIREMARK Smoke Detector with FIREMARK Door Holder-Release.
Detects smoke...releases doors...confines smoke...protects lives and property.
Employs an exclusive detection system that has years of proven reliability
in aircraft and industrial applications.

*Specified for use in: • corridors • stairways • offices • assembly areas
• storerooms • laboratories • record rooms • maintenance shops • boiler rooms
and to upgrade existing fire protection systems.

Architects and interior designers agree there is practically no limit to where and how decorative functional Stripline slot-type diffusers can be utilized. Regardless of the desired placement, Stripline's slim-trim conformation can be incorporated to blend in with the general scheme without calling attention to the mechanical installation.

When desired as a straight-line decorative border, curved, arched, or shaped to accommodate a slight contour, you can depend upon the versatility of a seamless continuous unit regardless of length.

Stripline slot-type diffusers are made of aluminum extrusions, designed with a slim-trim styling... no visible attaching screws... seamless appearance regardless of length... separate plaster frames... removable core... design eliminates complicated and expensive duct connections... simplified installation... built in diffusing vanes for engineered air distribution.

To assist in selecting and sizing the type Stripline best suited to your requirements, you can depend upon the reliable data printed in catalog ES. 105. Write for your copy.
You're looking at Philadelphia through a new glass from PPG that shuts out 70% of the sun's heat and has a "U" value of .35

It's called PPG Solarban™ Twinwindow—the latest and most effective Glass Conditioning product. It transmits only one third as much heat as regular 3/16" plate glass, cutting heat loss or heat gain 66%. And it transmits only about 20% of the sun's visible rays, greatly reducing glare.

What gives PPG Solarban Twinwindow these remarkable properties? Actually, it's two panes of glass enclosing a dry air space. On the air space side of the indoor pane, an exclusive coating reflects 46% of the sun's total energy.

Solarban Twinwindow is the ideal environmental glass in any climate or location. It provides the ultimate in indoor comfort. And the savings in heating and air conditioning costs may more than make up the difference in price.

PPG makes environmental glasses to control the sun's heat and glare on any orientation, of any building, in any environment. For details on these modern glass products, contact your nearest PPG Architectural Representative, consult Sweet's Catalog or write: Pittsburgh Plate Glass Company, One Gateway Center, Pittsburgh, Pennsylvania 15222.

APARTMENT COMPLEX FEATURES REINFORCED CONCRETE FRAME
(structurally and aesthetically)

LEHIGH CEMENTS USED

The Towers, Gateway Center, Minneapolis, Minn. Complex consists of 27-story and 16-story apartment buildings plus residential plaza and underground parking garage.

Exposed vertical columns of the concrete structural frame provide an attractive architectural effect to this dwelling complex in the widely known Gateway Center, Minneapolis. Spandrels of precast exposed aggregate concrete at two levels of the structure further enhance the beauty.

Lehigh Cement was used in the ready mix for cast-in-place concrete of the complex and Lehigh Early Strength Cement in the precast units. Lehigh Portland Cement Company, Allentown, Pa.

Owner: Knutson Companies, Inc., Minneapolis, Minn, and Countrywide Realty, Inc., New York, N. Y.
Architect: John A. Pruyn, New York, N. Y.
Consulting Structural Engineer: Wayman C. Wing, New York, N. Y.
Contractor: Standard Construction Co., Minneapolis, Minn.
Precast Panels: American Artstone, New Ulm, Minn.
Ready Mix Concrete: Ready Mixed Concrete Co., Minneapolis, Minn.
Meet the Caravan...  
a floating wall of storage engineered to shape space and create rooms.

The Caravan wall is more than just a new look at the old storage problem. An integral part of the home—and still movable—it actually invites an entirely new concept in home design. It can stand with its back against the wall; or as a peninsular room divider; even as an island of family activity in the middle of a room. Whatever its situation, the Caravan, offers unlimited space-shaping opportunities.

This unique moving wall of storage is the result of Western Wood and imaginative design meeting head-on. Its engineered truss allows it to be moved easily without a hint of racking.

The shelves require no supporting hardware; they rest on stock Western Wood siding pattern 115 (or any bevel siding pattern) placed upside down. The display shelves, the tape-deck cabinet and all tailored units are movable and interchangeable. No other building material meets the storage challenge with so much beauty and function as does Western Wood. Whether flat-side or edge, pure wood always turns its beauty-side out. Staining it highlights wood’s natural texture and grain; painting it is a breeze; waxing it brings out the natural warmth and beauty for all to see.

Our new idea booklet on storage is yours for the asking. It’s filled with full-color storage ideas, including three pages of illustrations on the unique Caravan moving storage wall, plus detail drawings. Clip the coupon and see for yourself.

The aluminum sun screens on the school building above are Deca-Grid style Borden Decor Panel. The lightweight panels were furnished with tilted spacers to provide the proper degree of shading.

The tilting of the Deca-Grid spacers is known as the slant-tab variation, in which the slant-tabs (spacers) may be mounted at angles of 30°, 45°, 60° or 90°. The slant-tabs may be specified in various lengths as well, depending on the chosen angle of mounting. With the Deca-Grid style, specifications for spacings and spacer bar positions may be varied almost indefinitely.

All the Borden Decor Panel styles, including Deca-Grid, Deca-Gril, Deca-Ring and Decor-Plank, are highly versatile in design specification and in application such as facades, dividers, grilles, fencing, refacing of existing buildings, etc. Fabricated in standard or custom designs in sturdy, lightweight aluminum, Borden Decor Panels provide a handsome, flexible, maintenance-free building component.

GOLD MEDAL FOR ENGINEER-ING to Ammann & Whitney, structural engineers, for Assembly Hall, University of Illinois, Urbana, Illinois. Architect: Harrison & Abramovitz; mecha-nical and electrical engineers: Syska & Hennessy; site landscaping consult-ants: Clarke & Rapuano; and general contractor: Feimley-Dickerson.

GOLD MEDAL FOR ARCHITEC-TURE (at left) to Sert, Jackson & Gourley, architects, for Francis Green-wood Peabody Terrace Married Student Housing at Harvard University, Cam-bridge, Massachusetts. Structural engi-neers: Nichols, Norton & Zaldastani; mechanical and electrical engineers: Sidney J. Greenleaf & Associates; landscape architects: Sasaki, Walker & As-sociates; and general contractor: Vappi & Company, Inc.

Academic Appointments
University of Michigan, Ann Ar-bor: Jacques C. Brownson has been named Professor and Chairman of the Department of Architecture. He has been design chief for C. F. Murphy Associates, Chicago. He replaces Professor Walter Sanders, chairman for 10 years, who has asked to be relieved of administrat-ive responsibility to devote himself to teaching and practice.

New York Institute of Technology, New York City: Professor Aly S. Dadras has been named Chairman of the Department of Architectural Technology. Professor Dadras, now a registered architect and city plan-ner in New York, heads his own firm of Dadras International City Planners.

Holland Firm Presents "A Program of Smells"
Steendrukkerij de Jong & Company, a printing concern in Hilversum, Holland presented "a program of smells" from August 16 to Septem-ber 22, created by Wim Schipper. The program catalogue explains thusly: "During the performances in the small hall of Steendrukkerij de Jong & Company there are many things of interest to be sniffed. The 22-year-old Wim Schipper, a young artist of whom it could hardly be said that conventionality is one of his qualities, opens the program with a presentation, produced with southern temperament, of a full-flavored Orange odor, which at once brings the odorence in a lively mood. The next smell, of a somewhat more serious character and of a deeper fragrance, is the pencil, immediately calling up memories of work, school and office. Then after the intermission, winter pleasures are recalled by Schippers by his wittily brought Anise. Unexpected sensuality is exhaled in the fourth and last part of the program; some of those present had already been noticeably restless under its influ-ence and from various twitching nostrils it could be seen that the sultry Musk, the basis of so many alluring perfumes, was familiar to many, though perhaps subcon-sciously. The program of scents presented here can be regarded as a proof that this young odorant may yet expect to attract much notice."

Step Up Communication with Architects, Producers Told
The expanding scale of architec-tural practice and—as reflected in recent court decisions—the ex-panding legal responsibility of the architect are also vastly expanding his need for reliable and current technical information about building products and materials, Archi-tect Charles Luckman told the 27th annual Building Products Execu-tives Conference in Washington, D.C. on October 7.

Mr. Luckman expressed amaze-ment at inquiries as to whether architects involved in large, com-plex projects could possibly inter-trest themselves in the selection of materials: "In our office, design and materials are considered to be synonymous."

Following the all-day conference, at which Mr. Luckman was the only architect speaker, President Wal-lace F. Traendly of F. W. Dodge Company, a division of McGraw-Hill, Inc., was host to the conference at a dinner at which the F. W. Dodge Construction Outlook for 1966 (pp. 121-128) was presented by Chief Economist George A. Christies, Jr.
GSA Names Architectural Advisory Panel

A panel of 17 architects has been named by the General Services Administration to review the designs of buildings erected by the GSA; to review GSA design standards and procedures and recommend any changes it thinks are needed or desirable; to advise GSA administrator Lawson B. Knott on selection of architects for "nationally significant" projects; and to propose criteria for choosing architects and drawing up contracts with them.

Serving on the panel will be Max Abramovitz, David L. Eggers and Grant Fordyce of New York City; Max Brooks of Austin, Texas; Joseph G. Durrant of Dubuque, Iowa; Max Flaton of Albuquerque; Albert S. Goleman of Houston; Robert F. Hastings of Detroit; James Hunter of Boulder, Colorado; George E. Kassabaum of St. Louis; Vincent G. Kling of Philadelphia; Charles Luckman and Henry L. Wright of Los Angeles; William G. Lyles of Columbia, South Carolina; Arthur Gould Odell of Charlotte, North Carolina; Cyrus Silling of Charleston, West Virginia; and Warren W. Taylor of Nashville.

President Signs Arts Bill And Transportation Bill

A new bill creating the National Foundation for the Arts and the Humanities was signed by President Lyndon Johnson in Washington on September 29. "We in America have not always been kind to the artists and the scholars who are the creators and the keepers of our vision," said the President. "Somehow, the scientists always seem to get the penthouse, while the arts and humanities get the basement . . . What this bill really does is to bring active support to this great national asset, to make fresher the winds of art in this great land."

In signing the Rapid Rail Transportation Bill on September 30, President Johnson said: "... The same science and technology which sends men to the moon and apply it to the problems of their profession. There were, however, many encouraging signs of progress. Mrs. Roslyn Lindheim of the University of California described a hospital research study that was a model of clarity and common sense, experiments with plastics being conducted at the University of Michigan demonstrate new construction methods, and the scientific study of perception and investigations into new uses of the computer seem to have many architectural potentialities.

At an evening session, Robert Geddes of Princeton outlined an A.I.A. sponsored program to study the nation's architectural schools.

Army Chief of Engineers Holds Award Competition

One first place and one honorable mention were awarded in the U.S. Army Chief of Engineers' first annual Distinguished Architectural Achievement Awards. The award winners were chosen from a field of 10 entries from all over the world and were selected by a jury composed of J. Roy Carroll, Jr. of the firm of Carroll, Grisdale and Van Allen, Philadelphia; Edward John Maher, of the firm of Maher and Marten, San Francisco; and Joseph D. Murphy of the firm of Murphy and Mackey, St. Louis.

Major General R. G. MacDonnell, Deputy Chief of Engineers, said the awards were the initial phase of a program designed to encourage quality design in all Corps of Engineers projects. "Our ultimate goal," said General MacDonell, "is to stimulate architects both within the Corps and in private firms to strive for a high degree of architectural quality, regardless of project size and budget."

Architect—Researcher's Conference Draws Many Participants

A conference on architectural research, sponsored by the A.I.A.'s Committee on Research for Architecture and the University of Michigan's Architectural Research Laboratory, drew a large group of architects and educators to Ann Arbor on October 7 and 8. The registration was nearly four times the 50 or so participants that had been expected, indicating that widespread interest in the architect's research problems came as a pleasant surprise to the organizers of the conference.

Despite the great degree of interest, it was clear that there is still a long way to go before architects can take the kind of technology that sends men to the moon and apply it to the problems of their profession. There were, however, many encouraging signs of progress. Mrs. Roslyn Lindheim of the University of

Othmar Ammann Dies

Othmar Ammann, designer of many notable bridges including the Verrazano-Narrows and the George Washington in New York City, died at his home in Rye, New York on September 22 at the age of 86. He was a principal in the engineering firm of Ammann and Whitney, which was organized in 1939.
There is virtually no limit to the design effects possible with Armstrong Luminaire Ceiling Systems. In this modern library, the versatile, new C-60 System permits a variety of module arrangements, allowing light levels to be tailored to the specific needs of each area—from entrance hall to study niches.

For complete information on the all-new C-60 Luminaire Ceiling System, including full application-engineering data and guide specifications, write: Armstrong Cork Co., Building Products Division, 4211 Rock Street, Lancaster, Pennsylvania.

Until today there were only two ways to cover a floor.

The hard way.

The soft way.

Hard on top, soft on the bottom... feels like deep pile, wears like tile — this is the carpet that's been muscling into all the tough spots. Like General Electric's World's Fair Pavilion. The Red Owl Supermarkets. The Pope Cafeterias (all seven of them). Cadillac Showrooms. Hospitals, schools, typing pools, restaurant kitchens...

And Densylon* maintenance! Compare the costs. 12c per square foot annually to keep Densylon in show-case condition as opposed to 22c for vinyl, 30c for vinyl asbestos**. They figured Densylon would pay for itself with savings in maintenance alone. And it has.

Made of the toughest, strongest, dirt-stain-abrasion-resistant yarn known to man—high density continuous filament Caprolan® nylon... woven twice as tight and dense as anything in the industry... bonded to a lifetime 3/16" slab of B. F. Goodrich sponge-rubber... cemented over any type of flooring... Densylon isn't all it takes to make a name for yourself but it goes a long way.

You don't have to settle for hard flooring anymore.
Now there's the right way.

Densylon.

Get the facts. Send for our booklet: “Densylon—A Breakthrough In Flooring Technology.” It is!

*CCC’s trademark for its sponge-bonded, high-density nylon carpet.

**From actual cost figures supplied by the Chicago Floor Maintenance Company—one of the largest contract maintenance firms in the world.

Please send me your Fact Book, “DENSYLON—A Breakthrough In Flooring Technology!”

Please send your representative to give us cost estimates on approximately ______ square yards of DENSYLON.

ARCHITECTURAL RECORD November 1965 39
Education Building Completed at Harvard

Roy E. Larsen Hall at Harvard University, Cambridge, Massachusetts is a seven-story, 47,200-square-foot structure which brings together many of the teaching and research programs of the Graduate School of Education. The building is set within a courtyard and is faced with traditional Harvard brick to relate to the older architecture of the University. The floor levels are defined by stringcourses of brick set vertically and by vertical slits of windows on two sides of the building. Grouped on upper floors of the structure are faculty and research areas with each floor organized around an informal meeting area. Architects were Caudill, Rowlett & Scott. Consulting engineers were Wald & Zigas; contractor, G. C. Wexler Construction Company.

SOM At M.I.T.

The recently dedicated $6-million building for the interdepartmental Center for Materials Science and Engineering at the Massachusetts Institute of Technology is a five-story concrete and glass structure which is parallel to and immediately north of M.I.T.'s main building (dome in background). Architects are Skidmore, Owings & Merrill and contractor was the George A. Fuller Construction Company.

Two Buildings Designed by Catalano Are Finished At M.I.T.

The $5.2-million Julius Adams Stratton Building at the Massachusetts Institute of Technology in Cambridge (above right) is a poured concrete and glass structure of five stories which will serve as a student center. The center contains dining areas, rooms for social events and student activities, and reading rooms. The Grover M. Hermann Building will house an economics library and social science departments. The five-story structure, including basement, cost $3 million and is of poured concrete, precast concrete and glass construction. Both buildings were designed by Eduardo Catalano in association with Robert C. Brannen and Paul Shimamoto. General contractor for the Stratton Building was G. C. Wexler Construction Company; contractor for the Hermann Building: Canter Construction Company.

Engineering Building Planned For Yale

The proposed $9-million Engineering and Applied Science Laboratory at Yale University, New Haven, Connecticut, designed by Architect Marcel Breuer, is a six-story precast concrete structure which will provide facilities for research laboratories, departmental library and offices. Subdivision of window openings by vertical mullions, according to Mr. Breuer, will contribute protection against sunlight. The first floor wall will be recessed behind the building’s supporting columns. A terrace level will be provided under which will be a truck dock, an audio visual hall, a lecture room and a lounge.
Proposed Montreal Building Integrates 425-foot Tower With Three-Story Base

La Tour Laurier in Montreal was designed by Craig, Zeidler & Strong in association with Beauvais & Lusignan so that the tower rises directly from street level and is interconnected with its base, because the architects felt that otherwise “the volume of the base and the tower would be out of proportion to each other.” All activities in the base are turned in towards an interior mall. The base also has three parking levels. The equivalent of the first six stories in the tower are visually opened and used to link the activities of the shopping colonades in the base with the office building. The building will contain 750,000 square feet and will cost $20 million. The developers and contractors are Three Star Construction Ltd.

English Buildings Preserve Park-like Setting

The Research and Administration Center of H. J. Heinz Company, Ltd. at Hayes, Middlesex, England is comprised of two buildings, the Administrative Offices, above right, and the Research Department and Laboratories, connected by a tunnel. Both buildings have only two floors above grade and one below so as to preserve the park-like setting. The buildings have reinforced concrete frames with glass walls set back five feet. They contain a total floor area of 125,000 square feet. Architects are the New York office of Skidmore, Owings & Merrill in association with Mathews, Ryan & Simpson.

New Macy's In Queens

The new Queens branch of Macy's Department Store in New York City is a 426-foot-in-diameter circular structure (except for a nick—see arrow—where a landowner would not sell) containing 326,500 square feet on four levels. Around the store and forming the exterior above ground level will be a multi-deck parking garage for 1,250 cars serviced by two helix ramps. Architects, Skidmore, Owings & Merrill: contractor, Walter Kidde Constructors, Inc.
PHOTOGRAPHY CONTEST
HELD IN GERMANY

Shown on these pages are the 10 top winners in the 1965 architectural photography contest conducted by the Association of German Cities. The theme of the contest was "Signs of the Future," and the reason for this theme was to show the progress Germany had made in the past 20 years in public building. Over 1,000 participants from 173 cities submitted about 3,000 pictures. The jury consisted of Joseph Walther Lollatz, deputy president of the German Academy for Town and Region Planning (retired), Essen; L. Fritz Gruber, commissioner and promoter of the Cologne Fair Corporation; and Jost Torbohm, member of the editorial staff of the German publication "Der Stadttetag." A total of 217 prizes were awarded including 22 cash prizes, top one being $500, 65 book prizes, and 130 special prizes from the cities ranging from $50 to $100.

First Prize: Skyscraper in the Berlin Hansa-Quarter; architects: Jaenecke, Samuelson; sculptor: Bernhard Heiliger; and photographer: Robert Häusser, Mannheim-Käfertal.

Second Prize: City Theater of Gelsenkirchen; architects: Werner Ruhnau, Ortwin Rave, Max von Hausen; and photographer: Martin Frank, Gelsenkirchen-Buer.

Second Prize: Mastersinger Hall, Nuremberg; architect: Harald Löbermann; and photographer Horst Harren, Nuremberg.
Third Prize: Friedrich-Ebert-Hall, Ludwigshafen; architect, Roland Rainer; and photographer: Werner Kortokraks, Ludwigshafen.

Third Prize: Skyscraper in Bremen-Neue Vahr; architect: Alvar Aalto; and photographer: Gudrun Lorisch, Bremen.

Third Prize: Apartment-skyscraper in Stuttgart-Fasanenhof; architect: Wilhelm Tiedje, Josef Lehmbrock; and photographer: Babette Kaemmez, Stuttgart-Fasanenhof.

Third Prize: Pedestrian Platform at the Theodore-Heuss-Bridge in Duesseldorf; architect: Friedrich Tamms; and photographer: Inge Goertz-Bauer, Duesseldorf.

Third Prize: Chapel at the “Waldfriedhof” (Cemetery) in Munich; architect Helmut Schoener; and photographer: Sieglinde Weigner, Munich.

Third Prize: Planetarium in Bochum; designer: Municipal Board of Works, Bochum; and photographer: Helmut Muschiel, Bochum-Weitmar.
Current Trends in Construction

“R & D” BUILDING—A NEW HIGH

It’s a bit unusual to deal with the subjects of industrial and educational building in the same context. Their obvious differences—private vs. public; commercial vs. academic—are what normally get the emphasis. But there are also some important links between these two seemingly unrelated building types, and not the least of them is that factories and schools are two of this year’s hottest construction markets.

Another thing these two building types have in common is that between them they give rise to an overwhelming proportion of all the laboratory and research facility construction that takes place, and it’s this feature that brings them together here.

One aspect of the many-fold increase in industrial research and development expenditures over the past decade or so has been the development of the research center, a building or complex of buildings—often in an entirely different location from the firm’s manufacturing facilities—devoted exclusively to pure and applied research. In 1965, industry has been responsible for roughly a quarter of all laboratory construction, and, as might be expected, the highly research-minded chemical industry leads all the others in such building. Also high on the list of industries which have been putting up new research facilities in a big way are rubber products manufacturers, building materials makers, and the electronics industry.

The really big share of lab and research facility building—most of the remaining three-quarters of the total expenditure—is done by the nation’s colleges and universities. And with the flood of Federal funds being made available through a variety of existing and new programs, academic research building is also showing the fastest rate of growth these days.

Laboratory construction is expensive building, averaging just over $24 per square foot. That makes the typical lab just about twice as costly to build as an equivalent unit of housing, for example, and well over half again as expensive as most types of nonresidential buildings. Research facilities built for educational institutions, incidentally, run significantly higher in unit cost than their industrial counterparts.

Regionally, the Northeast (New England and the Middle Atlantic states) generates a disproportionately large share of laboratory building. This area, which normally accounts for just about a quarter of the nation’s total building activity, was responsible for fully a third of all research facility construction last year. Reason: that’s where the heaviest concentration of colleges and universities is found. It’s also where higher educational building is expanding fastest, and laboratory construction is growing right along with the classrooms and dormitories.

With industrial and higher educational building booming along the way they are, it’s a cinch that the volume of laboratory construction will top half a billion dollars for the first time this year.

Robbins LOCK-TITE is an improved mechanically-fastened wood floor system at lower cost. Dimensional stability results from completely integrated design of 33/32" MFMA Northern Hard Maple flooring locked into steel channels anchored to slab. Asphalt-impregnated insulation board isolates the slab, improves rebound action through more uniform resilience, and reduces sound transmission. All installations of LOCK-TITE Floors are made and jointly guaranteed by Robbins and authorized Robbins floor contractors throughout North America. Mail coupon for complete data.
Building Construction Costs

By William H. Edgerton
Manager-Editor, Dow Building Cost Calculator, an F. W. Dodge service

The information presented here permits quick approximations of building construction costs in 21 leading cities and their suburban areas (within a 25-mile radius). The tables and charts can be used independently, or in combination as a system of complementary cost indicators. Information is included on past and present costs, and future cost can be projected by analysis of cost trends.

### HOW TO USE TABLES AND CHARTS

Building costs can be directly compared to costs in the 1941 base year in tables A and B; an index of 100 for a given city for a certain period means that costs in that city for that period are 2.56 times 1941 costs, an increase of 156.3% over 1941 costs.

**TABLE A.** Differences in costs between two cities may be compared by dividing the cost differential for one city by that of a second city, the cost differential of one city (10.0) divided by that of a second (8.0) equals 125%, then costs in first city are 25% higher than costs in second. Also, costs in second city are 80% of those in first (4.0 = 10.0 x 0.40) or 25% lower in the second city.

### TABLE B. Costs in a given city for a certain period may be compared with costs in another period by dividing one index into the other: if index for a city for one period (206.0) divided by index for a second period (150.0) equals 135%, the costs in the one period are 35% higher than those of the other. Also, second period costs are 75% of those of the other date (100.0 + 200.0 = 250%) or 25% lower in the second period. CHART 1. Building materials indexes reflect price paid by builders for quantity purchases delivered at construction sites. CHART 2. The $1.39 per hour gap between skilled and unskilled labor has remained fairly constant. CHART 3. Barometric business indicators that reflect variations in the state of the money market.
It's too late when the tenants move in

...to think about the many modern communications services that today's businesses use. Equipment to handle thousands of telephones. Television, teletypewriter, data transmission ... services like these.

Good design considers them in the blueprint stage.

Call the Architects and Builders Service at your local Bell Telephone Business Office.

No obligation, of course.

For further information on communications planning, see Sweet's Architectural File 334/86.

How to build a parking garage with 54 ft. spans and beams 2 ft. - 3 in. deep

USE THE PRESCON SYSTEM

Stadium Parking Garage East of the Civic Center Redevelopment Corp.'s Downtown Sports Stadium Project, St. Louis, has nine parking decks, each 510' x 216', providing for self-parking 2,640 cars. Levels 2 through 9 have beams (2'3" deep) and slabs (5" thick), both post-tensioned using Prescon positive end anchorage tendons. Concrete for the columns was placed only after the deck and beams to be supported had been post-tensioned. This permitted elastic shortening of the lightweight concrete decks, without restraint.

Transverse tendons, 216' long in both slabs and beams were continuous and were simultaneously stressed from each end. Longitudinal tendons were coupled at construction joints providing continuity. Mastic coated tendons were used in the slabs and grouted tendons in the beams.

If you are concerned with design flexibility or construction costs, or time, you should check the advantages gained from the positive end anchorage Prescon System of post-tensioning.

Write for copies of the Prescon NEWS describing many types of structures using post-tensioning.

This will roof nine squares

...so will this

It's BFG ONE-PLY, a complete self-flashing roofing system from B.F. Goodrich. ONE-PLY is made of Hypalon* synthetic rubber backed with neoprene-bound asbestos. Black or white. It's rugged, durable, quickly and easily applied. For roofs of nearly any shape. Lightweight? Nine squares of 4-ply, gravel-surfaced conventional roofing, in place, weighs nearly three tons. Just 365 pounds of ONE-PLY will cover the same area. And ONE-PLY offers big savings in on-site handling and installation costs. Performance? So good it's guaranteed watertight... free from leakage... for five full years under normal conditions. Want complete information? Just write Building Products Department RE-15, The B.F. Goodrich Company, Akron, Ohio 44318.

New Campus Rises In Canada

The partially completed new campus of Scarborough College of the University of Toronto was designed by architect John Andrews, who is associated on the project with Page and Steele, architects, to provide for a step-by-step increase of students from 500 to 1,500 and then to 5,000 over a seven-year period. Included in the first phase are four basic zones: the humanities; dining and recreational facilities; administration and library; and science. All of the buildings will have concrete exteriors, finished in various textures.

The humanities zone is designed with each succeeding story larger than the one below so that the building provides its own sun protection. Included are individual offices, seminar rooms and six lecture rooms varying in capacity from 50 to 200 students. The dining and recreational facilities, capable of accommodating 2,500 to 3,000 in Phase I, afford a variety of choices for meeting and dining. The administrative offices are grouped around the “meeting place” (section below), a four-story hall lit by 61 skylights, which will be the hub of university activity. Library space will also be provided in this building in the first phase. Interior pedestrian walkways will be provided throughout the project. The science building, which will contain 50 laboratories, is designed with each upper story becoming smaller to provide direct light through plastic diffusing screens in the sloping ceiling. Consulting engineers are Ewbank, Pillar & Associates, Ltd. and general contractor is E.G.M. Cape Company (1956) Ltd.

Condominium owners will enjoy 20% lower operating expenses with a Garrett total Gas energy system

Occupants of Salt Lake City's plush Canyon Crest Apartments will each own their own living quarters. And a Garrett total Gas energy system promises each owner heating, cooling, and electric power at a savings up to $20 per month.

Two Garrett-AiResearch Gas turbine generators will provide all power for the 17-story building. (A third will be held in ready reserve for standby.) The hot exhaust from the Gas turbines will be utilized to cool and heat 167,000 sq. ft. of living space, as well as provide domestic hot water and heat an outdoor swimming pool for tenants.

For total energy...Gas makes the big difference

Installed... Ceramic Tile
by Ginori of Italy
Costs No More!

By now you know there's nothing quite like Ginori Tile. The extensive variety of unique printed and embossed patterns, the refreshing Italian colorings, provide unlimited inspiration for dramatic decor. But did you know that the TOTAL cost of a Ginori installation, figuring both tile and labor charges, can compare most favorably with an ordinary installation? Let us prove it to you ... as we have proved it in numerous installations throughout America, in home and apartment developments, in hotels and commercial buildings!

ARCHITECTURAL RECORD November 1965 65
Our file cabinet has a nice clean face.

Note the drawer handles. There aren't any. No thumb latches that stick out, either. Or old fashioned label holders. Or knobby guide rods. Or any of those funny little gadgets found outside ordinary cabinets.

Nothing shows on our 500 file cabinet except a clean, contemporary look.

Take the recessed combination label holder and drawer pull. First of its kind. On one side is the label holder. Big enough to list the entire alphabet. On the other is the recessed pull. With just a couple of finger-tips your secretary can open the drawer. Without breaking a nail.

Our 500 file comes in 4 different heights, too. From 2-drawer to 5-drawer. All in letter or legal size width.

Everything about our clean faced cabinet is made the way office furniture ought to be. Furniture that looks beautiful and works beautifully—a solid investment for the management who pays for it.

The lowest brightness translucent louver commercially available. The American Louver Company, prime developer of the plastic egg crate louver, proudly announces this new development in brightness control. The 55° shielding louver (used instead of 45° shielding where high footcandle levels are required) is now available molded in lo-brightness translucent grey. Provides soft, glare free illumination. Efficient as over 70% of the panel is open, yet unobtrusive as the translucent grey blends harmoniously with the decor in the background rather than glaring whitely in all directions.

As the footcandle on the work surface increases, the brightness of the luminaire (or ceiling) must be controlled accordingly. The 55° shielding louver, molded in lo-brightness translucent grey makes tomorrow's level of illumination available today.
Planning Guide

PRATT PLANNING, HOUSING AND URBAN RENEWAL GUIDE FOR NEW YORKERS. By Robert Alpern; Edited by Astrid Monson and George M. Raymond. School of Architecture, Pratt Institute, Brooklyn, N.Y. 200 pp. $3.00.

The Pratt Institute has put together this very useful guide for New York citizens, in the hopes that it "will not only show the need for new planning policies, programs, and procedures, but also help get better results from the existing ones." To do this, the Guide lists and explains many of the city's departments, commissions and boards and their often very complicated procedures in city planning.

Pointing out the areas in which citizens can and should take part, Mr. Alpern discusses such subjects as "Neighborhood Character and Appearance," "Schools" and "Housing and Urban Renewal." He gives information as to hearings and notices as well as documents and publications which could help citizens to take a more effective part in city planning.

Such a book about a city would be must reading for any architect as well as the citizens. It might suggest a service A.I.A. chapters across the country could perform for their communities to help inform both professional and citizen participation in community planning.

Libraries

The architect concerned with the planning of library buildings should find this book a good substitute for first-hand experience. The author brings 60 years of experience to his task.

Keyes D. Metcalf, Librarian of Harvard College, Emeritus, has encountered many of the problems involved in planning a library building. Under a grant by The Council on Library Resources he has written this comprehensive book which is non-technical enough to also assist the laymen involved in library planning.

Libraries for the future are discussed initially. Of particular interest is the chapter on the modular system and why it is desirable in library buildings: "A building consisting largely of space that can be used for almost any purpose without extensive or expensive alterations should in the long run save money and prevent complications which so often arise as space requirements change. The modular system or some adaptation of it is now standard practice in libraries as well as in other buildings. Like most innovations, however, the modular system is not a panacea."

Other chapters include discussions of: height problems; traffic patterns; decisions regarding accommodations for readers and staff; problems connected with housing the collections; lighting, heating, ventilation; the program for mechanical facilities; site selection; and the technical details of specifications and contract documents.

The text is well illustrated with architectural plans and elevations. Five appendixes provide: examples of items for inclusion in the program; formulas and tables useful in determining ceiling heights, equipment sizes, stack capacities, card catalogue tray arrangements, etc.; a list of equipment; an annotated bibliography; and a glossary.

Industrial Architecture

These are the first two volumes in a series on modern buildings for industry and commerce. Volume I is subtitled "Plans, Structures and Details." These are arranged in order of subject under nine main headings.
New Air Wall partitions offer quick room change flexibility—plus the permanent beauty of Videne by Goodyear

A new portable partitioning system by Air Wall Division of Hupp Corporation reduces space changing to a 15-minute job. Simply inflate the patented “Pneumatic” locking system with air and the telescoping cap expands to hold panel firmly in place. Result: a “quick change” wall that looks like a permanent part of the room!

Hupp chose VIDENE Paneling by Goodyear to beautify and protect the Air Wall system. VIDENE paneling resists fading and marring like no other wall product. It will not chip, crack or peel with age and is highly resistant to abrasion and staining.

VIDENE panels come in 16 beautiful wood grain patterns that look and feel amazingly like actual fine wood veneers. Also 34 solid architectural colors and many abstract patterns.

Air Wall portable partitions are currently in use in thousands of fine commercial installations: Hospitals, restaurants, schools, churches, motels, offices.

For more information on Portable Partitions, write to Hupp Corporation, Air Wall Division, 8140 E. Rosecrans Ave., Paramount, California.

NEW DUAL-SERVICE INSERT AND FLOOR FITTING FOR CEL-WAY

Telephone and power outlets in one fixture!

Why one fixture is better than two. Granco’s new Cel-Way In-Floor Electrification System puts electrical and telephone outlets in one compact floor fitting. Result: you’ve just eliminated 50% of the floor fixtures. Imagine a finished floor like the one above, with these new, single, low-profile, satin-finish fittings. All the double-fixture, dust-traps are gone. Floors are now attractive, uncluttered, easy to wax and clean.

But that’s just the beginning. With Cel-Way, your installation costs are substantially reduced too. Compact, dual-service insert easily accommodates 100-pair cable; is roomy enough to house two amphenol jacks. The die-cast, contoured fitting and insert also make it easy to pull thick cables through cells to fitting. Marker screws pinpoint insert location for future use.

These are just a few of the reasons why you’ll find Cel-Way practical for your next in-floor electrification system. Write today for more information on the exclusive features and benefits of this promising new floor system. Granco Steel Products Company, 6506 N. Broadway, St. Louis, Missouri 63147.

For metal protection with design flexibility

... NEW FLUROPON BY DESOTO

Specify Fluropon™ and have the ultimate in metal protection—now and 20 years from now!

This new exterior metal coating fuses to aluminum or steel to form a hard film that lasts far longer than ordinary metal finishes. Fluropon will not delaminate; will not chip or shatter; will not show color differences from panel to panel.

Fluropon provides excellent resistance to humidity, salt atmosphere, acids, alkalis, corrosive chemicals, most solvents. Since detergents and acid cleaners do not affect its finish, Fluropon simplifies maintenance.

Wide Range of Applications

Flexibility in designing with metal is assured since Fluropon-coated metals can be roll formed, press formed, drawn, stamped—all without affecting adhesion. This makes it an ideal metal coating for components such as windows, doors, louvers, roofing, trim, hardware—as well as for colorful exterior panels.

For more complete information about Fluropon, ask for our colorful new booklet: “Now Exterior Color with a 20-Year Life.”

Problem: CUT ROOF COSTS ON CHRYSLER'S NEW ASSEMBLY PLANT

Owner: Chrysler Corp. Location Belvidere, Illinois
Architect-Designer: Smith, Hinchman & Grylls Assoc., Inc.
Contractor: Ragnar-Benson, Inc.

Solution:
STEEL ROOF DECK

This 1.9 million sq. ft. Chrysler Corporation assembly plant—the newest in the auto industry—is now under construction. The roof assembly chosen to protect the plant during construction and in final operation: Steel Roof Deck. Why? Because nothing does the job so well, so economically.

Owners like Chrysler Corporation insist on durability, appearance and over-all economy... and get it with Steel Roof Deck. Architects have the assurance of time-tested, time-saving roof construction... proved economical on job, after job.

Specify Steel Roof Deck the next time your job calls for an economical quality roof system... developed through industry research... backed by the industry's rigid product standards of quality. For detailed information, contact any member company of the Steel Deck Institute.

ings: site layouts and external facilities; building work; single story structures; basic techniques; circulation, communication, transportation; lighting; services; heating, ventilation, air conditioning; fire and lightning protection; and work offices.

There are some 3,000 dimensioned drawings which obviously took an immense amount of research work.

The second volume contains photographs, plans and elevations of 140 typical industrial and office buildings, drawn from 27 different countries. British and Continental architecture predominates but the rest of the world is well represented.

House Design

NEW HOUSES. Collected and described by Penelope Whiting, A.R.I.B.A. The Architectural Press, 9-13, Queen Anne's Gate, Westminster, London S.W.1. 168 pp., illus. 30s.

This book, a survey of 30 English houses, is a useful addition to an architect's collection of books on contemporary house design. Penelope Whiting, architect and housewife, shows houses which vary in cost, in purpose and in personal taste.

Of her purpose Miss Whiting has said, "The success with which architects have met their clients' brief without forsaking their own principles, will be discussed and an attempt will be made to show the factors which led to the various solutions." There is no attempt to assess modern architectural trends.

The author describes the occupations, needs and interests of each client, and the subsequent influence of these factors on the final design. In addition, she discusses clearly and concisely site planning considerations, the planning of each house, structure and materials and mechanical equipment.

For exterior colors with timeless beauty

...NEW FLUROPON BY DESOTO

Time, sun, the elements leave Fluropon's™ colors virtually unchanged for 20 years.

Why? Simply because this newly developed fluorocarbon polymeric coating far surpasses today's conventional finishes in color retention. Even under severest weather conditions, Fluropon won't fade, won't chalk.

With Fluropon, color match is never a problem—even in combination runs. Spray painting after forming not only allows exact color matching, but also provides flexibility in designing such building components as panels, soffits, doors, louvers, trim, hardware.

Fluropon's wide range of standard colors makes it a simple matter to attain dramatic effects using one color in mass, a complementary color in trim. And cleaning, even with strongest solutions, does not dim the luster of Fluropon-coated metals.

For more information about Fluropon, send for our new booklet: “Now Exterior Color with a 20-Year Life.”

In the Otisphere all signals are "Go"

With new "INSTANT ELEVATORING"* just touch the button...and your Otis is on its way. Any time.
This remarkable V.I.P. system of electronic controls automatically adjusts elevating service to any traffic needs. Anticipates service demands and instantly dispatches cars to where they're needed.

Call your Otis man in on your building designs. Ask him for complete details on this remarkable Otis development...how "INSTANT ELEVATORING" can be designed exactly to the needs of your client.

*Trademark of Otis Elevator Company

DeSoto guarantees to its customers a minimum of 20 years of useful decorative and protective life for Fluropon when applied according to the manufacturer's specifications.

For real economy in exterior metal protection

...NEW FLUROPON BY DESOTO

This new and colorful exterior metal coating costs less to apply to aluminum or steel than any other long-lasting finish. Costs less in the long run, too! Here's why:

Fluropon's®** applied cost is one-sixth that of porcelainizing (and there's no chipping or shattering); one-fifth that of anodizing (and there's no color difference from panel to panel); one-half that of laminated films (and there's never any delaminating to worry about).

Forget About Maintenance

As for maintenance or long-term costs, consider this: Fluropon's tough, smooth surface resists practically all atmospheric conditions, detergents, cleaners; retains colors at full value.

DeSoto guarantees to its customers a minimum of 20 years of useful decorative and protective life for Fluropon when applied according to the manufacturer's specifications.

For the full story of Fluropon, send for our new color brochure: "Now Exterior Color with a 20-Year Life."

Concrete gives a world trade center built-in sales appeal

The buildings of New Orleans' new International Trade Center are designed to serve the buyers and sellers of merchandise from every corner of the world. Here, through the imaginative use of concrete, is expressed the very spirit and pace of modern-day trade. In the Convention-Exhibition building, the New Orleans architects used a concrete barrel shell roof to create striking beauty, as well as an interior clear span of 253 feet, sufficient to seat 17,600 people. Textured exterior concrete walls provide tasteful contrast. The adjacent 33-story Trade Mart tower also utilizes concrete throughout. The highly compressible qualities of New Orleans' soils were mastered by prestressed concrete piles, providing firm foundations for the light but strong reinforced concrete frame and floors designed by advanced new structural criteria. Gleaming exterior curtain wall panels of precast concrete assure visual interest. An eight-story concrete parking tower is nearby.
The best ideas are more exciting in CONCRETE

International Trade Center dominates New Orleans skyline with spectacular architecture

Covering six city blocks, the all-concrete, 40-million-dollar New Orleans Trade Center, pictured in the illustration above, is located where the mighty Mississippi River meets Canal Street—the main thoroughfare of New Orleans. One of the widest streets in America, it terminates at the five-acre Plaza (1). Dominating the entire complex is the 33-story, 407-ft. high, reinforced concrete Trade Mart tower (2), providing 520,000 square feet of office and commercial space. The Mart tower is flanked by two other concrete structures, the International Exhibition Facility (3), a long-span, prestressed concrete barrel shell structure supported on tapered diamond-shaped columns, and an eight-story Parking Facility (4). Passing under the entire Trade Center complex is a six-lane section (5) of Interstate highway 310.

Undulating concrete shell roof of Exhibition Facility provides economical, column-free space

Long, cylindrical barrel shells roof an area roughly 420x452 ft. in the Exhibition Facility. Associated architects for the building noted: "The need was for a maximum column-free space to accommodate exhibit shows and large meetings. After months of study, it was determined that a thin shell concrete roof would accomplish a fluid architectural form which would compare favorably in cost to a conventional type frame." In addition to providing a fire-safe, low-maintenance structure spanning large areas, a concrete shell roof eliminates the necessity for a hung ceiling to hide unsightly structural elements.

Interesting architectural treatment was achieved by using diamond-shaped, cast-in-place columns to support the shell. The columns are skewed 45 degrees to the shell and taper from 5 ft. 6 in. at the floor line to 3 ft. 6 in. at the top. Models were used to study the relationship between shell and column to find the desired esthetic effect. Such freedom in form is obtainable only with concrete.
World's longest barrel shell span achieved by prestressing

Each barrel of the Exhibit Facility roof is 60 ft. wide and rises 18 feet. The thickness varies from 4 1/2 in. at the crown to 5 1/2 in. at the valleys where the shell flares into "V" shaped beams 5 ft. 6 in. deep. Through shell action and prestressing, a 253-ft. clear span was possible over the main hall, believed to be the world's longest for a barrel. A side span has a 139-ft. column-free area. In addition there is a 30-ft. cantilever all around the building.

The entire roof is prestressed in two directions. Draped steel strands used in each barrel over the main hall carry a force of 1,820 tons; similar strands in each valley beam carry 840 tons. The shell is post-tensioned transversely at the column lines. Design of the shell roof was based on concrete with a strength of 4,000 lb. per sq. in. at 28 days after casting.

Shell structure and six-lane highway underpass supported on concrete-filled tension piles

A 900-ft.-long, six-lane segment of Interstate 310, passing beneath the front section of the Exhibit Facility is incorporated into the foundation system of the structure, (see section). Since the surface of the Mississippi River, nearby, will periodically be above the roadway elevation, the structure must be held down by tension piles. Sixty-foot-long, concrete-filled shell piles perform this task. They were designed for an uplift force of 24 tons per pile.

Concrete framing and wall panels offer dramatic cost savings

Total cost of the completed tower, including interior finishing, was a little over 15 dollars per square foot, according to Harry Bloomfield, President of Bloomfield Building Industries, contractor on the Trade Mart tower. Mr. Bloomfield noted, "We do not believe we could have accomplished the Trade Mart in steel for at least 5 dollars per square foot more, and we feel we have a much better building with concrete."
Curtain walls of white cement concrete achieve dramatic architectural effect and economy

Precast concrete wall panels have considerable economic advantage over many other types of curtain walls. In construction of the Trade Mart tower, wall units were cast on each floor adjacent to their final positions on the frame.

1. Forms were composed of steel end bulkheads and plywood sides. Insulation, 1 in. thick, was first placed directly on the floor slab. It served as the bottom of the form and prevented panel concrete from bonding to the floor. But, its primary function is to insulate the panel from the building frame, thus overcoming most problems with air conditioning and heating. White, lightweight aggregate concrete for all panels was ready mixed. Typical cubic yard quantities are:

   - White portland cement: 611 lb.
   - Fine aggregate (sand): 1360 lb.
   - Coarse aggregate (lightweight expanded clay): 725 lb.
   - Water: 357 lb.
   - Air-entraining agent: 3.25 oz.

2. This cross-section of a typical wall panel shows critical dimensions and reveals its channel-shaped simplicity. The panels in most cases were 11 ft. 6 in. long with 1 ft. 8 in. protruding ribs. When hung on the building frame, the panels had a 4 ft. 6 in. space between them to receive metal window units.

3. The panels shown here, undergoing final inspection, were cured five days, or until a strength of 5,000 psi was reached, whichever occurred first. The unit in the foreground is a corner panel (648 required), other units shown are interior panels (1,404 required). Ribs are rubbed white concrete with contrasting areas between surfaced with a glistening white quartz aggregate set in a white cement matrix. Quartz is spread by hand and tamped into surface before concrete sets. Excess aggregate is blown off with air jets.

4. Erection of the panels was simple and expedient. With one end attached to a hoist line, the panels were lifted off the floor with a hydraulic hand truck and rolled to the floor edge where the hoist took over.

5. Once clear of the floor edge, panels were rotated 180 degrees and lowered into place. Steel dowels cast into the panels assured good alignment with the unit below. The hoist was on a monorail, mounted on a frame projecting high on the building. From the one position, many floors of panels could be set.

6. Fastening details are simple. Panels are attached to steel angles bolted to the concrete spandrel beams, two at top of each panel, and two near the bottom. Inserts to receive bolts are incorporated into the panels during casting.

7. Slotted holes in the steel fastening angles allow for minor adjustments in panel alignment. Hook eyes screwed into inserts cast into the top of the panel provide convenient pick-up points for the hoist line.

ARCHITECTURAL RECORD November 1965 117
The percentage is verified by an actual coast-to-coast survey... 2 out of 3 architects are familiar with plastic drawers and their uses. This means two-thirds of the profession is prepared to specify versatile and durable Amos Mod-U-Line Molded Plastic Drawers for applications like hotels, motels, institutions, dormitories, hospitals, schools, restaurants, stores, offices, homes and pleasure boats.

Here's what the majority of architects know about Mod-U-Line Drawers:

- **Amos Drawers** offer easy sliding... no sticking, warping, swelling or shrinking.
- Available in 8 different sizes.
- Smooth, non-splintering—non-snagging finish with easy-to-clean rounded corners.
- Uniform sizes and thickness.
- No maintenance costs.
- Absolutely no fabrication... no costly fabrication labor... Mod-U-Line drawers are ordered pre-built in quantity.

Now, if you are not in the majority, it's not too late to make amends. Simply write Amos for the new Amos Mod-U-Line Molded Drawer folder for your files or look it up in the new Sweets Catalog.

Please send me a new Amos Mod-U-Line Molded Plastic Drawer folder and a sample drawer for my own personal examination.

plant-produced
prestressed concrete shapes
fill a wide range of structural and architectural needs

These typical prestressed concrete units can be your answer in achieving quality, economy and an earlier completion date for your next structure.

DOUBLE TEE
Basic floor and roof panel member, span range to 60 feet. Also made as giant double tee in spans to 125 feet. This versatile unit simplifies and speeds erection of single and multi-story structures. May be used exposed with or without finishing. Excellent for long cantilevers. Creates dramatic effect used vertically as exterior wall panels. Underwriters Laboratory label service is available on double and single tees and most prestressed concrete products.

I GIRDER
Generally used as long span beam to support extremely heavy loads. Serves as principal girder in many beam and deck systems. Spans to 120 feet.

BOX GIRDER
Principal application as girder in heavily loaded structural framing systems. Void accommodates mechanical and electrical services. Also provides complete deck requiring grouting only between members. Ideal for industrial applications.

SINGLE TEE
Used for floor and roof structural decks in the longer span ranges, to 125 feet. Normally 6, 8 and 10 feet in width, each unit provides large coverage. Popular for exposed ceilings in gymnasiums, garages, bowling alleys, etc. Ends can be custom shaped to provide architectural treatment when cantilevered.

COLUMNS AND PILES
Square or octagonal piles in sizes beginning at 10" serve as foundation supports where poor bearing conditions are encountered. Precast columns, with or without haunches, are used as an integral part of the precast column-beam-deck concept which makes fast erection possible.

HOLLOW CORE SLABS
Major use is in office, commercial and apartment structures where flat ceilings are desired. Provides high insulation and low sound transmission. Voids may be used for mechanical and electrical systems. Shorter spans, to 40 feet.

INVERTED T BEAM
This basic component beam reduces total structural depth since deck members can be supported on haunches. Mainly used with double tee, single tee and hollow core slabs for structural framing including the deck sections.

MONOWING OR F SECTION
Primary roof and floor deck members, used to best advantage where hidden joints are required for architectural reasons. Provides spans to 60 feet with minimum depth.

CHANNEL SLABS
A very rigid member with minimum deflection characteristics at maximum load conditions. Used where heavy floor and roof loads are encountered in short and medium span ranges.

WALL PANELS
...of every description are made in precast and precast prestressed concrete for partial and full story heights for curtain wall or load bearing use. An unlimited choice is available in plain, sculptured, textured, or exposed aggregate units of all shapes and sizes. May be combined with insulating material for partition or exterior walls.

120  ARCHITECTURAL RECORD  November 1965
ANOTHER RECORD YEAR FORECAST IN
F.W. DODGE CONSTRUCTION OUTLOOK FOR 1966

Major Gains Expected
In Hospitals, Educational
And Public Buildings;
Modest Gain for Housing,
With Rental Market Favored

There is significant news for architects (and the engineers who work with them) in the F.W. Dodge Construction Outlook for 1966. Not only is dollar volume of total construction expected to reach a new record high of $51.5 billion, 4.2 per cent above the anticipated 1965 level, but some of the most notable gains are in exactly those kinds of construction activity in which there are the greatest opportunities for architects.

Hospital buildings are expected to have the biggest percentage increase of all; and public buildings, educational buildings and apartments are also among the five categories of building construction which are expected to show percentage increases of 5 per cent or more. Housing will have increases of 5 per cent in the one- and two-family as well as the apartments category, but "it will continue to be the kind of market favoring rental housing." Office buildings, manufacturing buildings and religious buildings are also expected to show increases next year.

The annual Dodge forecast for the year ahead, the major national indicator of future construction activity, is prepared by the Economics Department of F.W. Dodge, a division of McGraw-Hill, Inc. The 1966 forecast was first presented on October 7, at the 27th annual Building Products Executives Conference in Washington, D.C. Key excerpts from the major sections of the forecast follow.

The Community Demand
For Construction in 1966

The construction needs of the community, which involve everything from schools and hospitals to highways and missile bases, are mostly long-term demands which build up steadily over the years. While there is usually always a large backlog of requirements for such facilities, the key to short-run changes in the community types of construction (since most of these needs are met out of public funds) is the flow of appropriations through the many existing and new legislative programs which provide for such work.

The total of all community-generated construction activity (about equal in aggregate value to the big housing market, or worth roughly two-fifths of total construction contract value) has been advancing steadily at close to 5 per cent for each of the last two years. In total, 1966 will show another gain at nearly the same rate, although major changes will be taking place among the individual construction categories in this group.

EDUCATIONAL BUILDING is now getting very substantial financial backing from some important new Federal programs—a trend which began with the 1963 Higher Education Facilities Act. The current year brought further stimulation to school building with the passage of the Elementary and Secondary Education Act, and the very recent Higher Education Act of '65. The latter program, in addition to its teaching grants and scholarship provisions, expanded by some $160 million the college construction authority originally provided in the '63 Facilities Act. The result: educational building is now growing at a rate unlike anything since the grade school boom of the Fifties. Today, of course, it's mostly college expansion (classrooms and dorms alike) and despite 1965's 13 per cent gain, 1966 contract values will be up another 5 per cent.
Are you 500 people?
Or 5?

Executone intercom can cut your monthly phone costs.

And pay for itself in the bargain. Because an Executone company-wide intercom (500-station or 5) reduces costly callbacks. Breaks switchboard bottlenecks. Takes inside calls off your phones. Frees lines for incoming-outgoing customer calls. Tie in our pocket-page or a sound system and you get those important calls even when you're not at your desk. You're in touch with anybody and everybody in your company—and vice versa—instantly. Provable savings on your monthly phone bill will pay for your Executone system . . . giving you the benefits of two channels of communication for less than the cost of one! Whatever your business. You can depend on it.

For a portfolio of literature showing how Executone intercom can cut your phone costs, write Executone, Inc., Dept. J-4. Austell Place, Long Island City, N. Y. 11101

If it weren't for the cold, you wouldn't need Dow Corning 780 building sealant.

Most sealants stiffen with cold and lose elasticity. The colder it gets, the harder they become. When this happens, expansion and contraction often cause the sealant to crack or pull away—and that's the beginning of a costly and embarrassing leak.

One sealant that applies easily and stays flexible at all temperatures is Dow Corning® 780 building sealant. A true silicone rubber, this elastomer is unaffected by extremes of cold and heat, direct sunlight, ozone and ultraviolet. That's why Dow Corning 780 building sealant maintains a watertight seal indefinitely.

FREE SAMPLE: We'll send you a two-ounce sample tube of this remarkable sealant for your own cold weather evaluation.

Write Dow Corning Corporation, Dept. 0623, Chemical Products Division, Midland, Michigan, 48641. For nearest distributor, see Sweet's Architectural File.

*Eight months actual; four months estimated.

F.W. DODGE ESTIMATES as given in the 1966 Construction Outlook are shown above. They are based on construction contract value recorded (and anticipated) in the monthly tabulation of Dodge construction statistics on contracts awarded for future construction.
The Business Demand For Construction in 1966

The $10 billion package of industrial and commercial construction which reflects the building requirements of the business community has closely paralleled the vigorous growth of total capital spending over the past several years. The past year’s 8 per cent increase, following a 12 per cent expansion in 1964 (a pace nearly twice that of total economic activity), has made this group of construction types by far the fastest growing of the demand categories.

Manufacturing plants have clearly been the driving force behind this strong rise, but within the past year, store and office construction joined in the advance. In next year’s climate of somewhat slower over-all economic growth, business construction is still more likely to show a gain than a loss, but the gain this time will be quite a bit smaller—about 3 per cent. The key individual building types making up the business demand group can be expected to behave as follows:

MANUFACTURING BUILDING stands to be most directly affected by a change in the rate of total business output. With the three-year growth trend in manufacturing building contracts noticeably slowing in late ’65, next year’s course is apt to be quite flat, but providing a bit more in total over 1965.

OFFICE BUILDINGS snapped out of a 1964 slump and advanced sharply in 1965. The combination of low and stable office vacancy rates in most major cities, and a healthy backlog of plans for office buildings which haven’t yet reached the contract stage, indicate a high and rising volume of this type of building in 1966.

STORE AND WAREHOUSE BUILDING, after a period of very slow growth between 1960 and 1963, began to pick up in 1964 and shot ahead by more than 15 per cent in 1965. Demand for retail building will remain strong in 1966, though it will likely ease back a bit from the present unsupportable rate.

UTILITIES CONSTRUCTION settled back about 5 per cent in 1965 after the unusually big surge the year before. Renewed expansion in 1966 of electric generation and transmission facilities, natural gas pipelines, and communications is indicated by utilities companies’ growth plans, and should bring a new record contract total next year.

The Family Demand For Construction in 1966

Many different factors enter into the total demand for housing. The primary ones, which govern the need for shelter, are the rate of family formation and the volume of demolition of existing structures. These basic needs—which become modified by such other factors as population mobility, housing vacancies and families living together—are translated into effective building demand via changes in incomes, credit and government programs.

Once more, in 1966, there will not be enough of a change in any of these basic elements to get the housing industry really moving off the plateau it has been on for the past few years. The supply of mortgage funds has hardly been restricting housing growth; nor has the expansion of personal income. And neither of these factors is likely to change very much in the year ahead. Demolitions of the existing housing stock, which lead to the replacement of something in excess of 400,000 units (mostly rental) each year, are not apt to increase in view of the recent trend in urban renewal which emphasizes rehabilitation rather than removal of run-down housing. This puts the growth of total housing demand in 1966 squarely up to the most elementary factor of all—the formation of new households. And here, recent events offer great promise, but less in the way of immediate fulfillment.

The past year brought a big increase in the number of newly formed households, and the 1966 total will be large as well. Almost all of this growth, however, is developing from the celebrated young adult group whose members are finding...
RoWay motor operators permit fast, effortless door movement every time!

Consider convenience . . . automation in business demands automation in service facilities, a job admirably performed by RoWay electric motor operators. A "touch on a push button," and products passing through RoWay doors are picked up or delivered, moved or stored effortlessly, conveniently.

Consider reliability . . . automation depends on quality motors, switches, relays, starters. Since 1930 thousands of RoWay doors have been in constant operation, using component parts carefully selected for reliability by RoWay engineers.

Consider economy . . . automation motivates economy. Traffic moving through quick opening and closing doors earns time, saves heat or conditioned air.

Consider safety . . . doors, parts, personnel . . . all fully protected by a built-in clutch if moving doors strike an obstruction. RoWay electric motor operators and doors make for safety, economy, reliability and convenience. Consider calling your RoWay distributor. He has all the facts and figures on the complete RoWay Line, including wood, steel, aluminum and fiberglass doors.

there's a RoWay for every Doorway!
What's **BOHN** doing in St. Louis University's new Chemistry Building?

**COOLING IT!**

Heating it, too! Creating a comfort environment for academic achievement. In this ultra-modern facility, dependable BOHN central station and fan coil air conditioning units satisfy the comfort requirements essential to effective teaching and learning.

The new Chemistry Building is only one segment of St. Louis University's 150th Anniversary $53 million development program which will reach its climax in 1968.

In the oldest university west of the Mississippi, BOHN equipment supplies time-proven reliability. BOHN—the progressive name in air conditioning.

employment and setting up separate living quarters as individuals—as yet a rather low-powered source of housing demand. Growth in husband-wife families is showing little change so far, and marriages are only beginning to move upward.

Next year is likely to offer more of the same—another large gain in individuals and further moderate growth in marriages. It will continue to be the kind of a market favoring rental housing. The expansion in single-family housing demand which will develop from family formation is still only in its early stages, with the major impact a few years away.

A new element was introduced into the housing market in 1965, and that year’s Housing Act holds the potential of a major stimulus to homebuilding in the years ahead. The rent supplement provision and the several other features of the Act will undoubtedly raise the level of homebuilding, but the timing is apt to be delayed till late in 1966, at best.

Is next year going to be another soft year for housing, then? No, though it’s not likely to be a record-setter, either. Although there’s little prospect for a significant change in total housing demand next year, there is room for good improvement over the 1965 volume as the depressed Western housing market returns to a more normal level in 1966. And normal for the West is worth roughly a quarter of the national total, implying a pickup next year of close to 35,000 units. With the rest of the nation holding even (changes in other regions will just about balance out), the Western potential alone could provide an over-all increase in dwelling units of 2 per cent. In addition, the steadily upward trend in the size and cost of newly built housing can be counted on to provide another 3 per cent in next year’s residential contract value. Together, these forces will boost the dollar total for new housing in 1966 by 5 per cent.

It should be kept in mind that next year’s gains are not so much growth as they are a return to a more normal level of operations after a moderate decline. The broader expansion—which will get under way as the new housing programs take effect and as the anticipated sharp rise in marriages begins—is as yet more than a year away. Once it starts, however, the trend of home-building will be on the way up for a long time.

Regional Patterns In Construction

NORTHEAST—Construction activity in the Northeast is now accelerating after barely being able to keep up with the national pace over the last several years. The current advance, sparked by a fast rise in commercial and manufacturing building and a recovery in the New York City housing market, should continue in 1966.

MIDWEST—Ever since the demand for consumer durables and capital equipment began to take off early in 1963, construction in the industrial core of the nation has been moving up quickly. Business-related construction was still carrying the area ahead late in 1965, but more of the recent growth has been coming from housing. In the year ahead, both housing and industrial building are likely to weaken, causing total construction to ease back somewhat.

SOUTH—This area’s construction market is still digesting the fast-paced advance made during the early Sixties. The current shakiness in all major categories has made the South the weakest of the four regions through 1965. Look for a gradual improvement all across the board in 1966 as the area’s economic development and prosperity absorb the excess supply still remaining in some building types.

WEST—The decline in Western contracts which began late in 1964 can be attributed entirely to housing. In fact, steady advances in business and community demand have softened to a large extent the effects of the sharp drop in residential building there. Continued population inflows and general business expansion, together with a recent rise in unemployment in the West’s defense-related industries, indicate that housing can be expected to move ahead in 1966.

Copies of the F.W. Dodge Construction Outlook for 1966 are available upon request, to the extent of a limited supply.
Over one million bricks were replaced by Plasteel aluminum panels while the hospital continued its day-to-day operation.

Plasteel Aluminum Panels Revive VA Hospital

To replace the brickwork of the 14-story Veterans' Hospital in Boston, the U.S. Corps of Engineers needed special insulated metal panels. They had to maintain design and structural criteria while keeping wall weight to a minimum. Plasteel Products Corporation of Washington, Pa., suggested the right prescription with Alcoa® Aluminum, and they were selected to supply 140,000 sq ft of bright new porcelain aluminum panels insulated with polyurethane.

Plasteel Products excels in the fabrication of protected metals for the building industry and is an acknowledged leader in the production of porcelain aluminum panels. This job particularly required extensive modular planning. The modular package design improved the architectural features and resulted in a more economical renovation. To save installation time, Plasteel partially assembled the spandrel panels at its plant and shipped them partially built-up to the site.

Insulated aluminum curtain walls offer many unique advantages. They are colorful, strong and lightweight. They reduce installation time, cut heating and cooling costs and reduce maintenance problems. But best of all, insulated aluminum panels improve the appearance of any building... new or old. For more information to meet your needs, simply write Plasteel Products Corporation, McAdam Ave., Washington, Pa. 15301.

Over one million bricks were replaced by Plasteel aluminum panels while the hospital continued its day-to-day operation.

A new metal subframe to carry the aluminum window and spandrel panels was tied into the original reinforced concrete frame.

Deep-fluted Plasteel spandrel panels, manufactured from Alcoa Aluminum, were partially preassembled at the fabricating plant.

ARCHITECTURAL RECORD November 1965
Remember Styrofoam.

(If you’re not using it for roof insulation now, you probably will in a few years. So why wait?)

We’ve talked to architects and they’ve told us they think Styrofoam® RM brand roof insulation is the material of the future, the near future. And we believe them.

Styrofoam RM roof insulation is the new and better way to insulate built-up roofs. It has proved itself superior to other well-known roofing products. Matter of fact, can you name any other insulation that matches the advantages of Styrofoam RM?

That can’t absorb water? Acts as its own vapor barrier?

Won’t rot? Can’t collect mold? Has a low “k” factor? Won’t lose its efficiency? Is liked by roofing contractors because it’s so light, non-irritating to the touch, and easy to install?

No names come to mind? All the more reason for remembering that Styrofoam RM is the roof insulation of today—and tomorrow.

Want to know more? You’ll find it in Sweet’s Architectural File 10a/Do and 8a/Dow. Or write us. The Dow Chemical Company, Plastics Sales Department 1312N11, Midland, Michigan.

Styrofoam is Dow’s registered trademark for expanded polystyrene produced by an exclusive manufacturing process. Accept no substitutes . . . look for this trademark on all Styrofoam brand insulation board.

OK. Now forget it.

(Only until your next job, that is.)

Dow
Student Center looking west. Each main building is so placed that additional elements may be added at a future date without crowding.

Use of precast concrete permitted construction during severe winter weather.

Community College precast with Incor

New York's new community college in upstate Corning is one of many two-year colleges being built to cope with the mounting educational needs of the nation. Conceived as an entity, its structures have a consistent character. Each building is placed to accommodate future expansion without crowding.

Economical, fire-safe precast concrete was selected as the basic structural material for all buildings, with an exposed finish of beach pebble aggregate. Precast and prestressed "Spancrete" hollow-core floor and roof slabs—and over 1600 other concrete structural members—were produced at the precaster's yard and truck-transported 200 miles to the construction site.

On a construction budget of $20 per square foot, rigidly planned production and delivery schedules moved the project to a smooth completion during severe winter weather. "Incor" 24-hour portland cement in a 5000-psi mix was used throughout, assuring rapid turnover of the forms, and sound, high-quality units at low production cost.
Contemporary church architecture in the United States doesn't seem to be improving. Some architects appear to regard a church commission as a creative holiday from program and function, an opportunity to express a highly personal esthetic, and a chance to span a space like never before. Many churches do not represent a serious solution to the question of what a church should be, but suggest that the architect and key members of the building committee, if not the minister, consider a new church an anachronism in our culture, without a real purpose, and not to be programed and solved in an earnest manner as a school, factory or hospital might be. At their worst, a few current religious buildings appear to be the anxious designs of architects who seem tormented by a sense of God's absence, and are barely reassured by their own presence, as "formgivers" to an empty function. Three new Canadian churches by Affleck, Desbarats, Dimakopoulos, Lebensold and Sise indicate that these architects can be counted among those for whom liturgical function and tradition are authentic considerations, subject to analysis and the source of form.
St. George's Greek Orthodox Cathedral
In the choice of form for this church, consideration of tradition was the determining factor. The partner-in-charge and designer of the church, Dimitri Dimakopoulos, has created a neo-Byzantine structure, rectangular in plan, with a dome set within a cross formed by the perimeter of the mezzanine, a single bay of each sidewall and the plan profile of the screens to the left and right of the sanctuary. The architect's justification for working within an architectural tradition stemming from ancient Greece and the Orient, which was ascendant from 330 to 1453, is based upon the extreme religious and social conservatism of the Greek Orthodox community in Canada and the strength of its ties to Greece. This community still shares what Henri Peyre describes as "that aspiration to the sublime, that yearning for stability in the midst of a universe addicted to change that lay at the source of Byzantine art and culture." The ancient forms have been translated into a contemporary structural system consisting of a dome made of 12 precast concrete sections, the loads of which are transferred to a concrete support ring by short steel built-up columns; a poured-in-place-concrete lamella roof, and poured-in-place-concrete columns, which are not integral with the roof and are given separate articulation by steel supports at the intersection of column and ceiling plane. The brick walls are wedge shaped for acoustic purposes. A campanile, not in the Byzantine tradition but desired by the congregation, composes well with the building.

Byzantine churches were plain without and richly embellished within. The congregation of the cathedral has installed ornamental screens and other enriching elements to mitigate the raw but elegant simplicity of the exposed concrete and brick. It is possible that given time and increasing prosperity the faithful will decorate every square inch of the interior with marble and mosaic, thus acquiring considerably more tradition than Dimakopoulos could wish. Vestigial historicism, unfortunately, with time can become less vestigial. So far the depredation has been slight and the interior is unusually handsome.

St. Gerard Majella Church and Presbytery
While the Greek Orthodox Church endeavors to maintain its tradition and liturgy intact, the Roman Catholic Church is re-examining its tradition, reforming its liturgy and seeking appropriate architectural expression. From the great ecumenical conference still convening in Rome have come new directives for the celebration of the Mass. Since the end of World War II there have been two major attempts to define architectural consequences deriving from the Roman Catholic liturgy. The first, referred to as the directives of the German Liturgical Commission and published in 1947, stems from the clarification of principles developed by such leading German church architects of the twenties and thirties as Rudolf Schwarz, and Dominikus Böhm. Ten years later in 1957 the bishop of the Roman Catholic diocese...
View toward altar. Glazing is pale yellow.

The mezzanine, called "gynaikonitis," was traditionally for women.
For the exterior, honest expression of structure and modest materials is in the Byzantine as well as the contemporary tradition; for the interior a stricter historicism would require gilt and mosaic. The compromise: windows of yellow tinted glass in combination with ornamental metal screens. In the daytime, through this filter, the interior is bathed in a complex pattern of golden light, a hint of ancient richness.

For Superior, Wisconsin formed a panel which issued directives similar to those of the German Liturgical Commission but more detailed in analysis of architectural applications. Subsequent statements of principle in the past eight years reflect developing liturgical scholarship and practice. It would be an overstatement to suggest that the newer liturgical criteria will generate architectural forms yet to be seen or imagined. It is correct to say, however, that these directives help to create a church program to be resolved—a more challenging opportunity for some architects than the prospect of unlimited self-expression in the creation of an autonomous monument.

A careful examination of the plan of St. Gerard Majella suggests that its partner-in-charge, Guy Desbarats, and its design developer, Eva Vecsei, had the new liturgical formulations much in mind. The church and presbytery fill a rectangular site surrounded on three sides by boulevards and on the fourth by the church parking lot. The complex includes a meeting hall which because of the limited size of the site and cost considerations was to go in the basement. The soil conditions were not good, the water table was four feet below the then existing grade, making a deep basement excavation impracticable. The architects' solution places the entrance vestibule seven feet, six inches below the level of the nave floor and five feet above the basement meeting room floor.

The approach from the vestibule to the narthex doors, which open upon the nave main aisle, is oblique and up a flight of stairs. The entrance vestibule doors are approximately 42 feet from the sidewalk curb and front upon a shallow plaza. Reaching the narthex by means of a stair is clearly a solution to the problem of the high water table, but at the same time the stair plays a part in an entrance sequence which is in the spirit if not the letter of the following directive of the German Liturgical Commission: "However necessary it may be to remind people, preoccupied as they often are with the externals of life, of the existence of God, it is best to avoid building a church so that it gives directly on a noisy shopping street. It is desirable that on one's way to church one should pass first through an enclosed square to a formal atrium, and should thus have a moment of silence in which to collect oneself for the stillness of God within the church." The doors leading from narthex to nave are centered on the axis perpendicular to the main altar in harmony with the directive "that the treatment of the entrances, and especially the main entrance, should be so emphatic as to thrust upon the worshipper the parallel between the doors of the church and the gates of heaven." The plan carefully subordinates the side altar, for devotion to the Blessed Sacrament, to the main altar where the celebration of the Mass takes place. The German Liturgical Commission states:

"In planning the interior it would be wrong to take as one's starting point, as some have, not the eucharistic sacrifice but the devotion to the real presence in the reserved sacrament, and thereby
The forms of St. Gerard Majella were inspired by the great curved walls of the old baroque churches of French Canada.

The curving roof is high to accommodate the choir loft over the “Crying Gallery,” reaches its peak on the axis perpendicular to the main altar and quickly descends to provide an intimate low roof over the section reserved for private prayer and contemplation of the Blessed Sacrament. A careful attempt was made to emphasize in plan and function the primacy of the Mass.
to give to the atmosphere of the church a one-

sided emphasis on adoration and contemplation. It would be wrong because this devotion to the real presence in the reserved sacrament does not take first place among the purposes which a church must serve."

The location of the main altar permits the priest to conduct the Mass while facing the congregation, to emphasize the communal aspect of the eucharistic sacrifice. This is in accordance with the new procedures which have stemmed from the current ecumenical conference. The plan as a whole satisfies what the German directives postulate as the requirements of the Roman liturgy: "orientation towards the altar, emphatic opposition of priest and congregation, and provision for orderly processions in two directions. . . ." The plan also observes the traditional east/west alignment in which the altar is to the East focussing upon God who, like the sun, is symbolically enthroned there. The altar itself is placed in a clearly defined sanctuary and is visibly free from the surrounding walls. The German directives caution against too many windows in the wall behind the altar and the advice is heeded here. The plan follows the directives which assert that the sermon should be preached from an ambo at the altar rail, that the choir which leads the congregation in prayer and hymns should be up front, and that the baptismal font be given a room of its own. The German architectural directives on baptism are rather specific and were carefully followed (photo, page 139). "In the ideal church this 'spring of baptism' (fons) would be given a monumental treatment and placed in a separate room near the entrance. According to a venerable tradition this room should be circular or polygonal, with the font in the center; and the inward meaning of the ritual of baptism leads to the same architectural solution. For at the core of this ritual man appears not as an actor, but merely as the passive recipient of the mysterious action of God, and accordingly the appropriate architectural form is not a long room, which in symbolic language expresses action, but a room which is centrally planned, and which, since its axis is vertical, has a passive character."

A Wisconsin directive may account for the step of descent toward the font. It explains: "By this means the inner meaning of baptism as a mystical descent into the death of Christ and the corresponding ascent with him into the Easter life of resurrection is visually symbolized."

Tifereth Jerusalem Synagogue
The third religious building in the group by Affleck, Desbarats, Dimakopoulos, Lebensold and Sise is as different from the tradition bound St. George's Greek Orthodox Cathedral and the liturgically alive St. Gerard Majella as the first two are from each other. It has been said that the synagogue has no architectural tradition, Jewish temples of worship having always been constructed in the prevailing style of the period. Concern on the part of Jewish theologians for de-
The structure is of reinforced and precast concrete.

Walls are rough grey-buff brick. Translucent panels are fiber glass.

Baptismal font and other church fittings were designed by Jean C. Charuest. Font is one step down.
Developed architectural expression of liturgical belief has been limited to the discussion of such matters as the primacy of worship or study in the synagogue, or whether worship and study are perhaps synonymous. The ark with its tablet and scroll is considered to symbolically represent the centrality of the Law and is revered. The bimah represents the congregation in prayer, interpretation and study. The architectural prominence given the one or the other in the synagogue plan has sufficient relevance to Jewish life to become a subject of discussion in Orthodox, Conservative and Reform circles. The effect of the foregoing considerations on architectural form, however, appears negligible when compared to the subtly rationalized architectural concepts firmly asserted by Catholic and Protestant intellectual leaders. This lack both of tradition and liturgical assertion in the synagogue program gives the architect the disadvantage of fewer clearly defined requirements, and the benefit of no dogmatic rules. His job becomes the ordering of two functional elements, the ark and the bimah in relation to a congregation which doubles in size on the High Holy Days, and which therefore must occupy an expanding and contracting space. Study is done in separate classrooms.

SECOND-HOME COMMUNITIES

The best of these big new developments—usually outside commuting range of the cities, with housing intended mostly for weekend, vacation, and eventual retirement use—are establishing standards of environment and house design virtually unknown in the suburbs.

A comparison between housing in the good new second-home communities and the bulk of suburban and exurban communities may seem unfair. For one thing, the land is usually cheaper and/or more beautiful. For another, most of the houses are smaller than most families would accept for their year-round house.

But most of what makes the four second-house communities shown on the following pages so much more pleasant than most “development” housing are design ideas—in land planning and house design. Indeed, two of the four communities are located adjacent to other housing that is depressingly ordinary—a good indication that it was not special conditions, but special effort and talent that make the difference.

This comes, no doubt, as no surprise to the readers of ARCHITECTURAL RECORD. But there are three questions left to be answered. Why did the developers of these communities (unlike so many developers) retain architects and other professionals to do the designing? Why did the architects and other professionals who did the design (unlike so many architects and other professionals who “can’t be bothered” or “can’t make money” designing houses) involve themselves? And finally, why did the developers in turn choose to market their thoughtfully-designed product on the basis of design, instead of (like most developers) selling on a “choice-of-contemporary-or-colonial” or “glamorous-bathroom” basis? The success of these projects may well have some important bearing on the whole architect-homebuilder relationship. And if that is too hopeful a concept, may this article then serve as a kind of building type study for what is indeed a fast-growing area of construction—communities of second homes.

The best estimates put the number of second houses at something around two million—and the rate of building is accelerating along with discretionary income. Traditionally, vacation houses were “hideaways.” But increasingly, these houses are being built in communities of second houses like those shown on the following pages. The reason, says Charles Fraser, developer of Sea Pines Plantation (page 145): “25 years ago a family could pick a nice spot and build their vacation house. Today, ‘nice spots’ are hard to find. Further, people seem much more anxious to be near well developed recreation facilities than in the past, and perhaps,
The important word (and the single concept that links all four projects on the following pages) is *environment*. And while the environment of each of the four communities is very different, there is surprising consistency in the way that these different environments were created.

All of the projects started with big pieces of land—the smallest is 680 acres—but before the first earth was moved a detailed plan for the use of the land was complete.

In each case, the land plans are designed to minimize the disturbance to the land and most especially to leave untouched for the mutual benefit of all the homeowners the areas of greatest natural beauty. At Sea Pines, over 1,600 of 5,200 acres will be left as wildlife preserve. At New Seabury (page 148) 59 per cent of the land will be left open. At Sea Ranch (see page 152), the planned housing will scarcely intrude on the magnificent site, and each unit will share the ocean view.

In each case, recreation facilities are an important and integral part of the land plan—set up not as a special facility or park, but made a part of the total environment.

Typically, the housing has a contemporary feeling—and sometimes a playfulness or fanciful air that is not only appropriate to the vacation-weekend use of the houses, but refreshingly free of any suggestion that "status is sought here." (Idea worth entertaining: are the houses in the good vacation communities so much better than most suburban houses not just because interested architects have designed them, but because budget limitations and the obviously-called-for use of inexpensive and simply finished materials has imposed a useful design discipline?)

Significantly, while the two projects that have been under development for some years (Sea Pines and New Seabury) both started as all-single-family-house projects, both have been revised to include at least some rental and condominium higher-density housing. And the plans for both projects that are just getting underway—Bryan Beach and Sea Ranch—include complexes of higher-density housing.

All of the communities are planned to include a strong social focal point—a higher-density complex of restaurant and low-rise apartments and/or condominiums, or a major clubhouse complex, or—as at Sea Ranch—a country store.

All of the communities have strong covenants and architectural controls, vigorously applied by a committee (in all cases including the architects involved in the project) which can bar new building on purely esthetic grounds. For example, Hanslin (whose New Seabury committee includes the four architects who work actively with him) says: "Our sole interest is control of the environment, and our powers are extremely arbitrary. We also control what the homeowner does with his property—he must maintain it (or we will and bill him); he cannot change the color of his house or cut down a tree or build a fence without our approval; and we have, for example, required one owner to remove his Radio-Free-Europe-size television antenna."

But the most important common element of these four second-home communities is this: They are being designed by teams of professionals—architects, landscape architects, land planners, engineers, conservation experts and others—working effectively together with developers who are playing for big stakes—and the long run.
Sea Pines Plantation
Hilton Head Island, S. C.

VARIED LAND USE,
CONSISTENT DESIGN

Sea Pines Plantation is at the southern end of the biggest ocean-front island between New York and Florida, reached by a bridge from the shore road near Savannah. Most of its 5,200 acres is beautifully wooded with live oaks, pines, sabal palms, magnolia, myrtle and hickory trees. Two sides of the project open on broad ocean beaches; the “inland side,” laced with creeks, faces a protected bay.

In the late 1950’s, as the first step in the development of this land, Sea Pines president Charles Fraser retained land planner Hideo Sasaki to develop the master plan, which was promptly awarded the Certificate of Excellence in Design of the American Society of Landscape Architects. Its major features:

1. A cluster scheme (see drawing, below right) for waterfront land that puts up to six rows of lots on the desirable ocean side of the road, with wide walkways—owned and maintained by the company—that open most houses (even those well back from the road) to an ocean view and provides auto-free access to the beach for all.

2. The fairways of the golf course (designed by golf course architect George W. Cobb) spread out through developed (or to-be-developed) areas, rather than being concentrated on a solid block of land—a device which vastly increases the perimeter that can be developed as sites.

3. Over 1,600 acres of the 5,200 acres is permanently set aside in its natural state as a refuge for wildlife. Indeed, in total, the master plan contemplates only 2,200 homesites in the 5,200 acres.

Another early step was the retention of Yale University law professor Dr. Myres S. McDougal, who developed the concepts of the deed covenants which have helped maintain a uniform character for the work of several different architects (see following pages).

In the six years since the master plan was drawn, some changes have been made, but the over-all concept has been consistently maintained. The major changes:

1. “We vastly underestimated the demand for recreation, even though it was an important element in the original plan,” says Fraser. Examples: A second golf course has already been added, and the master plan is being revised to include a third and a fourth. Also in the planning stage: a marina and sailing center on the bay, skeet and trap ranges, camping areas, horseback riding area and stables, and swimming pool area.

2. A new focal point for the community—a “townlet” with docks and other waterfront facilities surrounded by townhouses and stores—is planned for the near future. The existing focal point—the 80-room William Hilton Inn, owned and operated by the developer—is not “enough of a center for the growing population.”

At Sea Pines, much of the land is set aside in wildlife preserve. Arrows indicate the fairways of the golf courses. Below, schemes for sites along ocean, and along fairways.
Houses at Sea Pines are all custom designed, but all in character

Detailed covenants and architectural controls apply to all housing. The most important are those governing exterior materials and finishes (most houses are bleached cypress and redwood) and restricting changes by the owner in house or site. The architectural controls are administered by a committee, headed by Fraser and including local architects, which is empowered to bar construction of a house on "purely esthetic grounds." Fraser built a number of prototype houses—designed by architect John Wade—to establish the character of the area. "We had to persuade the first 25 or 30 buyers to adopt our indigenous style—people wanted southern colonial, columns and all," says Fraser. But since then (see sampling above) there has been great consistency in the design of the 187 houses which have been built (800 lots have been sold).

Some lot buyers, Fraser says, have houses designed by architects from their home area, but the bulk of the houses are now done by two Savannah firms—McGinty and Stanley Associates, and Corkern and Wiggins—both of which maintain offices on the island.
Three-bedroom townhouse has two-story-high living room opening to porch and yard screened by extended side walls.

One-level, two-bedroom townhouse has compact, well zoned plan. The architects for both units are Collins & Kronstadt.

The biggest planning surprise has been the demand for condominiums

Last year, developer Fraser retained architects Collins & Kronstadt of Silver Springs, Maryland to design some one- and two-story, two- and three-bedroom condominium clusters for sites along the golf courses. No sooner had construction begun on the first cluster of nine than they were sold. And within 60 days, a second cluster of 18 (just being completed), a third cluster of 16 (just being started), and a fourth cluster of 18 were presold. And there is now a waiting list of 40 families. Why the demand? Fraser thinks there are several answers. First the prices ($21,000 for the three-bedroom, two-bath condominiums) are well below the median price for custom houses ($27,500) and lot ($7,500) at Sea Pines. Second, condominium owners can have the staff of the nearby William Hilton Inn clean and maintain the unit and its landscaping. And perhaps most important, Fraser feels that the condominiums are attracting a different group of buyers than those who will undertake the uncertainties and self-discipline involved in having a custom house designed. The condominiums offer a package—"here it is and here is what it costs."
Land at New Seabury is divided into 14 villages, each planned around a different kind of recreation. Example, below: riding trails serve as greenbelts between houses in High Wood.

**NEW SEABURY**
Waquoit, Cape Cod, Massachusetts

**A SERIES OF VILLAGES**
**BUILT AROUND RECREATION**

New Seabury is a 3,000-acre area of beaches, cranberry bog, salt marshes, and woods being developed in a unique way by Emil Hanslin & Associates. The land has been planned as 14 separate villages (see plan), each separated from the next by belts of open land or water, and each planned and designed to attract families with different interests (and different budgets).

Hanslin opened the first village—Bright Coves—in 1962. Laid out to put almost all houses on natural waterways threading in from the beach, it was designed to attract swimming and boat conscious families. Land in this village is now 85 per cent sold out, and 96 houses have been built there. The second village to open, in 1963, was High Wood, an equestrian center with stable and riding trails (see opposite) that form a green belt between houses. Three other villages are currently under development—Triton Sound, a community of houses on large lots overlooking the sea, Summer Sea, a cluster plan community for families who want close neighbors, Greensward East, a community of homes on the golf course. Still to open; two more golf course communities, several communities of high-density rental and coop units on the water, a purely summer-rental village reminiscent of Cape Cod’s Provincetown art center, a village for hunters and freshwater fishermen in an area well away from the ocean, a village on a protected cove for less adventurous sailors, a quiet river village, an artists and writers colony, and a community of lower-priced houses. There were, in the original plan, 11 villages. Hanslin dropped the idea of a retirement community: “It’s a great marketing idea—Come join the party! But I don’t think it’s a good idea—everyone gets old together.” He added three golf-course villages around the courses originally planned in open space.

The original concept was Hanslin’s—but he promptly brought in a consulting team of widely varied talents including land planners, landscape designers, architects Robert Woods Kennedy, Royal Barry Wills, Robert Damora, and Rudolph Bedar and Phineas Alpers to develop the concept and design the houses (following pages). Group discussions were held to suggest schemes and establish goals. After that, says Hanslin, “they all went back to their offices to find their own way to the goals.” Significantly, only one of the original “team” of architects is no longer designing houses for New Seabury. Three firms (pages 150 and 151) have become part of the effort within the last year. And Hanslin is now actively searching for other outside-of-New England architects who will work into the project. To date, 200 houses have been built—all but 20 of them designed by team members—and over 500 lots have been sold.
Clubhouse is sited to serve both of the courses at New Seabury, doubles as a community center. Architects: Bedar & Alpers.

In High Woods village: trails wind in and around the houses. Stable is nearby.

In Bright Coves village: catamaran taxi takes owners . . . to gaily striped tent which serves as the beach clubhouse.

Recreation facilities are everywhere and "indispensable"

Only 30 per cent of the land at New Seabury is planned for building sites; 59 per cent is open and recreation space. "And the use of this open land is critical to the success of the project," says Hanslin. The original plan called for a small-boat marina and tennis-court complex, a beach club, a riding academy, a golf course, and trails in the wooded areas. In the three years of the project, a second golf course has been added, the riding facilities have been tripled in capacity, the trails and open spaces are now laid out to a much more sophisticated plan.

Hanslin recently retained two conservation experts to choose the best land to be left for conservation and wildlife preservation and to overlay a conservation map on the land-use map.

The only major change in the original recreation plan: the addition of the golf clubhouse (designed by Bedar & Alpers) which includes a bar and restaurant. "This was needed less for the golfers," says Hanslin, "than as a focal point for the community, especially during the winter months [the beach club serves in the summer]."
The first display houses at New Seabury, designed by three different architects (see text), established "team" concept.

For the second village: house by Royal Barry Wills Associates . . . and house by Bedar & Alpers. Note "salt-box" form.

Robert Woods Kennedy's second house, for the "riding village."

The first house for New Seabury by Claude Miquelle.

The houses at New Seabury: some solid New England, some more for fun

The first houses built at New Seabury were (top photo, left to right) designed by Robert Damora, Royal Barry Wills, Bedar & Alpers, and (house not shown) Robert Woods Kennedy. The Damora house has won a host of design awards, including an Award of Merit in the 1965 AIA National Honor Award Program, and was a Record House of 1962. Since then (see above and opposite) the Wills firm, Kennedy, and Bedar & Alpers have each designed at least two new houses, variations on their basic designs, and custom houses for lot owners. Architect Claude Miquelle has joined the "team" with two houses. About 20 houses have been designed by other architects chosen by lot owners—"and we welcome this," says Hanslin, "because it adds fresh talent to the project."

There are some common design characteristics—all of the houses are designed and materials chosen to minimize maintenance. Most relate closely to the outdoors, with big glass areas and decks. And most—in deference to the built-for-sale market—are at least reminiscent of one or another of the basic New England forms.
Next year’s models include this Bedar & Alpers house, which can have various bedroom arrangements around the living area.

Also new: this house by Claude Miquelle, again reminiscent of the New England salt box, but opened wide with a big deck.

Ahead: more new houses and more community facilities

The photo and drawings above show two of next year’s display models by Bedar & Alpers (top) and Claude Miquelle (the two Miquelle houses will be featured in an upcoming issue of Better Homes and Gardens). Both are typical of the flexible designs of most New Seabury houses: For example, in the Bedar & Alpers design, by arranging bedroom wings around the central living room-kitchen core, the house can be built with anywhere from one to six bedrooms.

Now in the preliminary stage by Katzman Associates: a shopping center. The central mall of the center will have booths and kiosks for selling food and the arts and crafts of Cape Cod. Tables and benches will be spaced about for relaxation. “We hope to create,” says Hanslin, “something of the feeling of the Farmer’s Market in Los Angeles.”

Also in the planning stage, by Los Angeles architect Richard Leitch: a series of about 100 condominiums or rental units to be built around a year-round resort hotel—all separate from the village centers. These additions will serve as additional focal points within the project.
Much of the land will be left in (1) commons and (2) fairways. Drawing shows (3) ocean-terrace sites, (4) golf-course lots, (5) forest lots, (6) condominium village, (7) shopping facilities, (8) recreation area, (9) commercial zone, (10) stable compound, and (11) airport. Below: typical cluster scheme.

DESIGNED TO SERVE
THE LAND IT USES

The extraordinary and almost untouched beauty of this 5,000-acre stretch of California coastline north of San Francisco demanded exceptional planning to permit its use by people without destroying its special qualities.

Its owners, Oceanic Properties, Inc. retained Lawrence Halprin & Associates as land planners and landscape architects, as well as architects Joseph Esherick & Associates, and Lyndon, Turnbull, Moore & Whitaker; and civil engineers Sarles, Breije and Race. And from the beginning of the project, planning, landscape and architectural considerations have been interwoven. Simultaneous studies and analyses were made of the natural factors—sun, wind, fog, rain, vegetation—and of the few examples of indigenous architecture to discover the particular characteristics of the area. And the results of these studies have been exploited to the full in both the land-use planning and design of the buildings and facilities.

In the first phase of the master plan, three kinds of residential areas are being developed: the condominium apartment units set on a grassy terrace with water below (see opposite and page 155); the ocean terrace lots on the great open plain with its parallel hedgerows; and the hillside lots, also for individual houses (see page 154) in the forested area above the terrace.

Two important principles underlie the disposition of these types. One is that the special elements which give the area its distinctive beauty—the hilly slopes, the open meadows, and the beaches—are kept in common ownership so that their beauty is shared (and maintained) by all and the integrity of the natural landscape remains unchanged. The other is that residential units are clustered so as to keep as much as possible of the land free and open, and in common ownership. Thus, on the ocean terrace, all lots front on a great common; and in the forested section, lots open onto steep land and look out over the terrace to the ocean. The condominium has its common area, also.

Included in the master plan is a land management program based on “dynamic conservation”: native grasses, once plentiful, are being brought back by extensive reseeding; forests are being thinned by “prescribed burning”, a streamlined version of the old Indian method; lost meadows are being restored; trees are being planted to provide growth of various ages to maintain forests. Overgrazed lands—these pastures have been used for over 100 years—are being reconstituted and grazing has been curtailed but not eliminated, as there is still a sound economic basis for some agricultural use. Where the coastline has receded (due to overgrazing and wind erosion) fill is being placed to restore an earlier line.
Prototype condominium is sited on broad meadow sloping down to the ocean cliff. Its unusual shed-roof form grew out of . . .

wind studies by architects and planners, which showed flow patterns over the cliffs, and over and around hedgerows.

The ecological studies included research on wind conditions and solar radiation—and their effect on human comfort. What these studies showed directly influenced the design of the Sea Ranch buildings. The shed roofs act much as the hedgerows do to provide a windless area on the ground adjacent to them (see charts). Solar radiation studies indicated how much and where glazed areas could contribute to comfort indoors. Bioclimatic studies to determine heat, air conditioning, and shade needs affected design, and were incidentally translated into a chart to show clothing needs for comfort outdoors at different times of day and different seasons.

In such a place, the activity of recreation becomes of secondary interest, for the place itself is recreation. Beaches, common areas, hills for hiking and walking invite an individual approach to recreation. But there will also be facilities for group activity: a golf course, croquet and bowling lawns, and—in sunken areas for protection from the wind (see page 144)—several tennis courts and a swimming pool.
House by Joseph Esherick uses rough and simple finishes appropriate to area and to the vacation-time use of the buildings.

The prototype houses reflect the character of the land

Four houses designed by Joseph Esherick, demonstrating architecturally the same principles which are guiding the land development, have been built and are on display to prospective buyers. “Rough and simple,” in keeping with the natural environment, the houses are designed to make possible an easy in-and-out relationship with the out-of-doors and to provide the best possible views from each site. Large windows on the south side admit sunlight and warmth, and look down the coast.

The houses are clustered so that they appear as a unit from a distance, make use of the hedgerows to gain protection from wind, and are oriented—as are the hedgerows—at right angles to the coast. (The usual approach of lining up sites parallel to the coast would have blocked at least part of the view from all but the lowest row.)

Shed roofs are either shingled, like the exterior walls, or sod, a further tie with the land. A louvered fence around the patio is designed to draw the wind in and out in an upward flow, a system which permits some almost tropical plants to grow in the wind-free garden.
The condominiums are “enclosures within enclosures”

The condominium apartments, designed by Lyndon, Turnbull, Moore & Whitaker, are the first of several such clusters of units. Bioclimatic and wind studies not only dictated the shed roofs and the skylights—which admit plenty of sunlight and keep the apartments comfortably warm—but suggested the omission of most openings on the north side. Each of the 10 units has views to the ocean, and some also open to the courtyard, where the angles of the roofs, the plain board surfaces of the exterior walls and the windows—sometimes protruding, sometimes recessed—provide an unexpected linear and spatial experience. Inside there is more diversity; as the architects describe it, “...enclosures within enclosures, starting with a basic 24-foot cube surrounded by glass bays, terraces and decks, themselves enclosed. Inside the cubes, more cubes: a two-story box with kitchen below and bathroom above; or a four-poster space enclosing a hearth-centered living area with a skylit sleeping room above, enclosed for privacy by canvas canopies.” Again, materials are simple and easily maintained.
Land plan for Bryan Beach uses canals and lake areas as open space. Over two-thirds of the houses are directly on the water. This is a much higher-density complex—at top is prototype model for a rental apartment area, built just off the harbor. Below, a detail section of the land plan, again the apartment complex.

Bryan Beach
Freeport, Texas

HIGHLY DESIGNED USE OF HIGHLY DEVELOPED LAND

Construction of this 680-acre project is just beginning on one of the few major expanses of open beach left on the Texas Gulf coast. The land—held by the Bryan family for over 100 years—is 58 miles from Houston, and 40 miles from Galveston; bounded on the inland side by the Intracoastal Waterway but with access to the Gulf.

The developers, Bryan Beach, Inc. of Houston, retained Houston architect Clovis Heimsath to develop an architectural concept and land plan for the area. The plan (drawing, left) is based on a series of canals that put over two-thirds of the lots (1,237 of 1,817) directly on the water. The canals are 78 feet wide, and 7 feet deep at low tide, so they can accommodate almost any pleasure boat; are bulkheaded with steel-reinforced concrete. Material dredged from the canals and the 26 acres of lake area (see plan) has been used to fill the land areas from +3 or +4 feet to +9 feet—above any anticipated hurricane high-water level. (The distances that fill could economically be hauled or pumped greatly influenced the configuration of the waterways, reports architect Heimsath).

As a result of this land-development work, which involved 82,710 feet of bulkheading (and was engineered by Brown & Root of Houston, engineers and contractors) Bryan Beach property is insurable with full coverage for loss from hurricane, rising water, and wave and wash damage.

Recreation facilities are an important part of the plan. The canals will make this a prime area for yachtsmen and fishermen, and a 40-acre marina development on the Waterway is already completed. To be built, on a site open to both the lake and the Gulf: a clubhouse complex with dining room and meeting halls, a swimming pool and tennis courts, and a "children's marina" on the lake side for small fishing boats and sailboats. Several private beach sites have been spaced along the Gulf.

Something over 150 lots have been sold—at prices ranging from under $4,000 for lots not directly on the water to over $8,000 for lake lots and around $25,000 for Gulf lots. Most owners plan on building for vacation and/or retirement use. There is no present plan to allow any bulk sale of lots, and the company has turned down offers by homebuilders. Lot owners who are ready to build are referred to Heimsath, but may choose any architect they wish. Designs are, however, subject to approval by an architectural review committee which includes the president of Bryan Beach, a representative of the major lenders on the project, and Heimsath.

While the bulk of the housing will be single-family (see opposite), there are prototype designs for three and four-plex units (page 158), apartment-motels (left), for-sale townhouses, and a resort hotel.
Larger prototype house puts low bedroom wings around the dominant central living area. Quiet living area is on upper level.

Small prototype house fits same design concept—strong, low, horizontal lines topped by pitched roofs.

Prototype houses are being built to set a design standard

Along with the land planning, architect Heimsath was asked to design a series of prototype houses for Bryan Beach. The two houses shown above, says Heimsath, “were designed to echo the strong horizontal lines of the flat land and bulkheading with a strong horizontal roof line, topped with a series of pitched forms.”

In the smaller prototype, the pyramidal roof is the dominant design element, and—as the plan shows—is hollowed out to make a master bedroom and bath on the second floor. In a similar model, the roof creates an open skylighted ceiling for the central living area. In these houses, as in the larger house at top, a variety of flat-roofed bedroom and service-room wings can be “plugged in” to the central living area.

Architect Heimsath is developing other prototypes on different basic forms, but is emphatic that “once the project is far enough along for a good design standard to be established, I think it is important that other design-oriented architects be brought in to enrich the project with a diversity of approaches.”
Second-Home Communities

Four-plex units, designed primarily for off-the-water sites, turn inward to their own sheltered swimming and recreation area.

Also in the prototype and planning stage: higher-density housing

Mixed in among the single-family houses—"haphazardly I hope," says Heimsath—will be a number of three- and four-plex clusters. The drawing above shows one prototype, echoing, of course, the same flat-planes-with-pitched-roof concept as the prototype houses. These will probably be built on the much-cheaper lots off the water, and turn inward to their own private patio, garden, and swimming pool/recreation area.

Further, (drawing on page 156), a cluster of apartment-motel units will be built around a small harbor off the Waterway, adjacent to the marina and a restaurant-shopping area. "This section will be rental housing. We expect that many units will rent to year-round residents, since Freeport has a shortage of apartments." The area will be incorporated as a club "for Texas reasons" (county laws curtail use of liquor in public restaurants). In a cluster on the Gulf side of the project a resort hotel will be built, separated from the single-family residential area by clusters of built-for-sale townhouses, and it will doubtless serve as the social center of the new community.
CONCRETE FOR SHADE AND PATTERN

Design for Child Care Center in Chicago, by George Fred Keck and William Keck, makes use of concrete overhangs to break the sun and provide decoration too.

Regarding the design of this new building for Chicago's oldest charitable institution, architect George Fred Keck says, "In past years we have been identified with sun control, and continue to be concerned with the functional uses of sunlight and with attempts to equalize its seasonal effects. Here we go one step further, continuing to hold to the functional elements, but making them available also for decorative use. The aspects and shadows on sunny days are then constantly changing the patterns of light and shade as the sun runs though its arc each day. This effect does away with the heaviness typical of in situ concrete buildings, and introduces a new lightness for such structures."

The plot was small, yet it was necessary to provide off-street parking and outdoor play space in addition to the three-story building itself. Thus, a large part of the ground floor building area was given over to play space, much of it under roof for use in unfavorable weather. Access to this area from the second floor is provided by ramps (see plan on next page), regarded by the architects as better than stairs for children under six.

A placement center for adoption and foster care occupies the top floor, which includes a medical clinic and a series of offices for interviews. The remainder of the building is given over to facilities for the day care of small children with working mothers and an experimental pre-teen after school play group. Mechanical equipment, including the air-conditioning plant, is located in the penthouse. A generous basement provides ample storage space.
A detail of the perforated concrete sunshades is shown in the photo at top left; a typical group activity room at top right; an office for adoption and foster care conferences immediately above. The structural frame of the building is of reinforced concrete; the roof is framed with steel joists and a concrete deck; floors are concrete slabs variously finished with vinyl tile, ceramic tile, or terrazzo; ceilings are of acoustical plaster; sash are aluminum, glazed with sheet glass; partitions consist of steel joists plastered; interior doors are wood—exterior doors aluminum.

Mary Barnheisel Building; Day Care Center and Staff Offices, Chicago Child Care Society, Chicago, Illinois. Weiboldt Company
AN INGENIOUS USE OF A NARROW SITE

The blank street facade of this club house conceals an open and spacious interior.

The club building is one of the most interesting problems an architect can encounter, and opportunities to design them are becoming increasingly rare. Most flourishing clubs today are really second cousins to hotels or restaurants; but the design of an authentic private club provides an opportunity to study a sequence of several spaces, and to work out their relationships to each other purely in terms of the effect they will have upon the observer. This building in New Haven, Connecticut, designed by Professor King-Lui Wu of the Yale School of Art and Architecture, is modest in scale; but it achieves its effects in the true club tradition. The building becomes a private world, a secure retreat, in which every element has its own importance and its scale has been carefully controlled.

Professor Wu has used the narrow urban site to good advantage, hiding his building behind tall garden walls and a blank facade rendered more mysterious with an intaglio mural by Josef Albers. The garden, designed by landscape architect, Dan Kiley, and...
the interior courtyard permit large areas of glass and bring light and air deep into the building. The interior courtyard is a complicated multi-level space, with its reflecting pool and reflecting glass areas providing an outlook for all the rooms. The site is small and irregular in shape, but the major spaces have been given a definite form by treating them as pavilions. The living room is square with a clerestory all the way around (the glass is opaque to keep neighbors from looking in), and the ceiling is coved so that the artificial lighting will create a clerestory effect at night and also balance the light during the day. The same balanced light principle is employed in the dining area, where a large scoop skylight brings light down on to the blank north wall. The shape of the hung ceiling helps relate the reflected light from above to the direct view into the courtyard. Below the dining room is a music room with a piano and record player, and, a half level lower, there is a small study library.
The club is designed so that it can be used both for formal meetings and by individual members stopping in at odd hours of the day. The garden more than doubles the effective area of the living room in good weather, providing an excellent setting for large parties or receptions.

The entrance hall is given skylights and niches to accommodate the club's collection of paintings and sculpture. The service entrance is separated from the main door as far as is possible on so small a site, and partially screened by the chimney of the dining room fireplace which is pulled out from the wall for this purpose.

All exterior walls consist of 4-inch by 4-inch by 16-inch concrete block with a marble aggregate; some of the interiors are paneled in walnut, and the floors are of Italian marble, bluestone and walnut blocks. All cabinet work was specially made, and the dining tables and chairs and the Moroccan rug were manufactured to Professor Wu's design.

Music room receives light from inner courtyard.

Skylight brings light down on blank wall in dining room.
Interior court is complicated, multi-level space.

Entrance hall is also gallery for painting and sculpture.

Architects often deplore that most competition winning buildings, when finished, show extensive revision of the premiated concept, so that design quality frequently gets lost in the process. The Toronto City Hall, on the contrary, has been executed by the late Viljo Revell in a partnership with John B. Parkin Associates with unusual fidelity to the essentials of the Finnish architect's much criticized basic scheme, which won an international design competition held in 1958. For this reason, both the majority and minority viewpoints of the competition jury, which have been included on the following pages, are still pertinent to any assessment of the finished complex.
The Competition: Judges Did Not Agree

There were 520 submissions from architects in 42 countries to the international competition held in 1958 to select the design for a new city hall and civic square for the city of Toronto.

Of the eight projects which reached the finals, the scheme of Viljo Revell was stated to be the unanimous choice of the five competition judges. (The group of judges included an Englishman, Sir William Holford, two Canadians, C. E. Pratt and Gordon Stephenson, an Italian, Ernesto Rogers, and an American, the late Eero Saarinen.) Their reports of seven years ago can now be tested against the reality of the completed structure.

Since Holford and Stephenson, while agreeing that the Revell design was the most original in conception, had reservations on several important aspects of the winning design, both a majority and a minority report were issued. The minority report is here presented in part:

"The jury were unanimous in regarding the winning design as the most original in conception of any of those submitted.

"They were less unanimous about the suitability of this monumental design to the site prepared for it, and as an answer to the requirements of the administrative programme. On this there were strong differences of opinion—as there are likely to be in any democratic assembly.

"As a minority we were highly critical of some aspects of this design. We were also conscious of the carefully drawn conditions, the cost of the project in the minds of the council and the public, and the need for a building which is efficient and workable, and flexible enough to meet the requirements of growth and change. . . ."

"Since no worthwhile judgment is entirely uncritical, (our) reservations may also be useful to strengthen or modify the design of the city hall and the city square as it is finally executed.

Relation to the City

"1. On the east and north sides, and to some degree to the west as seen from University Avenue, the winning design shuts out the city around it, presenting the blank concrete walls (356 feet and 290 feet high) to surrounding streets and buildings. This might have an adverse effect on the future redevelopment of these sectors; whereas the new city hall could otherwise be expected to spark off a number of surrounding projects, eventually leading to a really significant renewal of this part of the city. Much could be done to reduce this adverse effect.

"2. The city square, which in our opinion should hope to attract citizens of all ages in a rich and varied way, still appears in the final stage of the competition as a somewhat stark design. It could be given greater landscape interest and amenity, and a more human scale.

The Building as a Work Place

"3. The four main elements in the scheme—the civic square, the four-level base or podium (which covers nearly half the site), the two office towers, and the council and executive suite—are connected to each other by an external ramp, by escalators, by a large number of elevators in ten different places, as well as by emergency stairs. Internal circulation within the building is complicated, as it involves movement from one office tower to another or to the council suite; and the one-sided office towers have longer horizontal lines of communication than are found in two-sided arrangements of offices.

"4. The council chamber and suite, although placed in the very focus of the design, have defects as working accommodation, and a poor outlook.

Structure and Cost

"5. The form of construction proposed for the office towers is probably the most expensive which could
Council chamber at podium level.
Ramp leading to podium was planned for ceremonial purposes.

Pool will be used for skating in winter.

Square sets off former city hall.
be devised for vertical slabs. The huge cross-buttressed reinforced-concrete walls support floors which are, in effect, trays cantilevered in one direction. The open ends of the trays are covered by a glazed curtain wall. It is doubtful whether the cantilevers would register in the mind of an external observer, and it seems reasonable to suggest that the form of construction could be modified and reduced in cost.

"5. Because of the variety of unusual structural forms, and the considerable space demanded for circulation, the design as presented would, in our estimate, cost much more than the figure which the council had in mind. By considerable revision, economies in space and structure could be made without changing the main effect of the composition.

"Both in the conditions of competition, and in the report of the jury on the preliminary stage, the need for reasonable economy was stressed. In order to realize the design and preserve its integrity, even with the revisions suggested, the council should be prepared to increase the sum voted."

In December 1956, less than a year before the competition rules were established, Toronto voters approved the allocation of $18 million for their new city hall. Costs of the winning scheme estimated in 1959 were $24.4 million. The cost to date of city hall and square has been $27.035 million (including $900,000 for a cafeteria not in the original estimate).

The majority report proposed two options: To choose "a relatively low, horizontal building, placed within the square . . . detached from the buildings around it, achieving an effect of dignity by its simple contrast with its background. . . . (We) regarded this concept as very promising and indeed, five of the final proposals are in this category. (Alternately) the city hall could be a distinctive building, different in form and materials from standard commercial buildings. It would be impressive when seen from the square and its immediate neighborhood, and also a distinctive feature of the silhouette of Toronto as seen from the distance. In appraising the eight finalists the majority concluded that the winning architect had achieved a design which fulfilled this last approach excellently. . . . The design of the square is very important. The winner not only
The council chamber seats 300 persons.

Pre-cast panels were used as exterior formwork. Striations are Italian Botticino marble.
achieves a handsome space but successfully emphasizes the present city hall, a building which (we) regard as a most handsome example of its period. The placing of the council chamber is also of great significance. For this the majority favoured the idea of emphasizing its location as a symbol of democratic government."

**Design and Structure**

The allocation of space in the city hall relates closely to the system of government in Toronto, consisting of both the City of Toronto and the Municipality of Metropolitan Toronto. This dual aspect of the government is suggested by the two towers themselves, which enclose the council chamber, considered the unifying element.

The structure of the council chamber consists essentially of three portions. The first portion is the roof, which is a reinforced concrete dome with a prestressed ring beam, supported on inclined precast concrete struts. The second portion is the main body of the structure, an inverted cone with two prestressed ring beams. The generator of the cone is inclined at an angle of 30 degrees to the horizontal. This cone is supported by the third portion of the structure, a cylindrical reinforced concrete shaft which passes down through the podium to a foundation on shale.

Structurally, each of the two towers consists of a convex curved reinforced concrete wall referred to as the "back wall," and an interior line of columns. Each floor is supported on the back wall, and cantilevers beyond the columns to the glass line on the concave face of the towers.

For design purposes, the towers were considered to be vertical cylindrical shells reinforced by a series of transverse diaphragms (the floor slabs) and also reinforced by longitudinal columns or buttresses.

LABORATORY BUILDINGS:

The Architecture of the Unpredictable

By Jonathan Barnett

The requirements of a scientific laboratory today are not the same as they were a few years ago, because the scientist client has acquired a more sophisticated appreciation of the ways in which a building can help or hinder his work. The time has past when a scientist moved to a new building from a structure that was either completely outmoded or had never been designed for scientific work in the first place. Today the scientist has either worked in a new laboratory building himself, or has had ample opportunity to meet and talk with those who do; and in the process he has acquired a long new list of likes and dislikes.

The basic problem, of course, remains the same: how to provide for flexibility and growth. Scientific research can be concerned with quantities so small that they are invisible under a microscope, or with problems so large that they must be dealt with in conditions resembling a factory. A scientist may surround himself with vast quantities of incredibly intricate and delicate equipment, or he may simply sit looking out the window and scribble an equation on a blackboard from time to time. The trouble is that no one knows when the equation scribbler might desert his blackboard and start feverishly assembling equipment, or when the researcher probing the nature of the atom might decide it would be helpful to construct a building two miles long. The course of Science is by its nature unpredictable, so that the shape of research facilities must needs be unpredictable as well.

This unpredictability affects the design of laboratories in many different ways. It affects the relationship between office space, bench space, and special equipment areas, it affects the location and distribution of piping and air-conditioning, it affects the design and placement of laboratory furniture and equipment, and also the elaborate shielding and insulation that many experiments require.

It is no longer sufficient to talk of flexibility in terms of modules, and of growth in terms of adding a new building. At the same time, flexibility is likely to be the most expensive of requirements; and provision for growth can interfere with present operations.

For the convenience of the reader, this Building Type Study is divided into five sections: Planning for Flexibility and Growth; Planning the Laboratory Complex; The Distribution of Services; Placement of Furniture and Equipment; and Problems of Shielding and Contamination. It should be understood that this division is to some extent an arbitrary one, as the problems discussed in each section are closely interrelated.

GRID PLACED ON SITE

BUILDING DEVELOPED FROM GRID

1. TEACHING LABORATORIES  2. SERVICE ROAD  3. LIBRARY  4. LECTURE ROOM  5. RESEARCH AREAS  6. UNDERGRADUATE AREAS  7. LECTURE ROOMS AND STORAGE  8. CAR PARKING

ARCHITECTURAL RECORD  November 1965
There is now some general agreement that, in considering the science areas of universities, we are no longer considering separate buildings but a general principle or system of layout in which individual departments and faculties form part of a larger concept.

—Professor Sir Leslie Martin writing in *Architectural Design*

Science areas in universities have more flexibility and growth problems than industrial laboratories; not only must there be areas for teaching as well as research, but also all the scientific disciplines tend to be grouped in one place. As a result, more and more architects are trying to develop comprehensive systems which will relate the needs of various departments and disciplines and provide ways of sharing certain facilities, such as lecture halls and teaching laboratories. In addition, such a system can provide an architectural recognition of the increasingly interdisciplinary nature of much scientific research: for example, by placing Bio-physics between Biology and Physics, with the capability of expanding in either direction.

The system developed by Sir Leslie Martin, and shown at left, consists of a regular grid derived from considerations of space, lighting, and an integrated system of structures and services. The grid forms 35-foot squares separated by five-foot strips. Ducts and services can be introduced at any point within these strips. The system is also divided vertically, with large areas such as lecture halls, work-

Laboratory Buildings:

shops, and special laboratories for heavy equipment at the lowest level, teaching laboratories above, and research areas on top. As shown in the drawings, the grid can be applied to a site, giving a rough indication of present areas and future expansion possibilities. Architectural development can go on in stages, in relation to the grid, forming segments of a larger system rather than single buildings.

Industrial research facilities do not yet require such a comprehensive solution. The studies of an industrial research complex by The Architects' Collaborative that appear on the previous page show the type of planning that is usually needed. It is still essential to visualize approximately what the ultimate extent of the building complex will be, in order to make meaningful decisions about individual units. It is also necessary to determine lines of development and of growth for circulation and services.

Industrial laboratory space is likely to be more uniform than a university or government facility. The range of research is relatively narrow, and, as there is no strong tenure system, industry is less likely to design a laboratory around the requirements of a particular scientist. At present, therefore, Industry tends to think of new laboratory space in terms of adding blocks of a set size and type. The long-range outlook, however, is probably towards the more flexible approach already employed by the universities.

Skidmore, Owings and Merrill's Chicago office has been devoting quite a lot of attention to the development of comprehensive laboratory grids for universities, like the one shown on these pages. Such grids lend themselves to growth of almost any shape, and in almost any direction.

RIGHT:
A building unit in this system which employs a diagonal grid, and some laboratory arrangements that would be possible.
Laboratory Buildings:

Feasibility: Structural: Compact plan may reduce cost. Mechanical: Although cores are separated, short mechanical runs reduce cost. Circulation: Double loaded corridors most economical. Flexibility: Changes may be made easily.

Feasibility: Structural: Compact plan. Mechanical: Separated cores and double runs of ducts, etc. may add to cost. Circulation: Doubling number of corridors is uneconomical. Flexibility: Rooms may be changed and added with ease.

Feasibility: Structural: Compact plan may reduce cost. Mechanical: Compact system may reduce cost. Circulation: Double corridors uneconomical. Flexibility: Not as flexible as scheme above.

PLANNING THE LABORATORY COMPLEX

There are four basic areas in any laboratory complex: the area for research itself; the administrative offices; general support facilities, such as an auditorium or a cafeteria; and service facilities, such as shops and the boiler plant. The addition of teaching requirements does not change this pattern as much as might be imagined. Elementary science courses are taught in special teaching laboratories and demonstration lecture halls; but more advanced students are quickly integrated into the research organization. Undergraduates at many universities are already working on research projects during their last year, or years; and graduate students, while technically still being instructed, are in fact engaged upon independent work.

The research areas are naturally the portion of the laboratory complex that presents the most problems. The chief difficulty with the other elements is to prevent them from interfering with the design of the research areas. A badly located auditorium or boiler plant can strangle expansion and interfere with efficient operation. The most comprehensive method of avoiding such difficulties is an over-all planning grid such as the one described in the previous section of this article. In any case, a master plan must make provision for independent growth of all four of the basic elements of the laboratory complex, either through a campus type of development, or through sufficient articulation and separation of each area.

LEFT:

RIGHT:
Four plans by Walter Kidde Constructors, Inc. showing different basic methods of organizing an industrial laboratory (from ARCHITECTURAL RECORD, November 1965).
Laboratory Buildings:

The research portion of the laboratory is itself divided into several basic elements. Most research areas require desk space as well as bench space; and more and more experiments are requiring some sort of controlled environment, with closely regulated temperature and humidity, or the elimination of outside contamination. Controlled environment installations and other ancillary facilities frequently cannot be accommodated within the ordinary research areas. In addition, scientists frequently wish to have conference rooms directly associated with research, and there are usually some fairly extensive storage requirements.

Economy of construction can conflict with efficient operation. Bench areas and special installations require elaborate piping services and air-conditioning; desk space, conference rooms, and storage areas do not. Bench space and special installations are usually fairly large areas, desk space, conference rooms and storage form smaller units. In terms of economy it makes sense to group like functions and like areas; and separate desk space and conference rooms from research. Unfortunately most scientists prefer desk space to be near their research, and special installations need to be associated with research as well. The design of teaching laboratories provides an analogous situation, with less need for desk space, but a requirement for preparation rooms. Resolving these contradictory requirements, while still providing for flexibility and growth, is perhaps the most difficult problem in designing a laboratory.

Theoretically the possible solutions range from placing all desk space in a separate building to incorporating all offices within the laboratories. The

LEFT:

RIGHT:
A comparative study by Skidmore, Owings and Merrill of different ratios of office and laboratory space possible within a single, flexible system.
degree of separation possible, and the ratio of one type of space to the other, varies from discipline to discipline. The studies by Skidmore, Owings and Merrill on page 181 give a graphic representation of some of the possibilities, within a flexible space system which can be used for either purpose.

The comparative study of eight different teaching laboratory layouts, by Hellmuth, Obata, & Kassabaum, which is shown on page 178, assumes that all office space is located in a separate wing. Each method of organization is evaluated in terms of economy of construction and mechanical equipment, circulation and flexibility.

A comparison of four basic types of industrial laboratories, designed by architect Frank Whitney of Walter Kidde Constructors, Inc. is shown on page 179. The first one places the desk space within the laboratory itself. The second places the offices on one side of the corridor and the laboratories on the other. The third plan provides core laboratories and perimeter offices; the fourth provides a peripheral corridor and interior laboratories, with the desk space again incorporated in the research area. These four plans are representative of standard practice; most laboratories will be found to conform to one or another of these basic classifications.

There are, however, other possibilities. Eero Saarinen's design for the IBM Research Headquarters in Yorktown Heights places both laboratories and offices within a peripheral corridor system. If you accept the concept that all working accommodation should be interior space, this is a highly efficient and consistent method of organization.

Some laboratories are organized as

**LEFT:**
Science building at Hollins College by Douglas Orr, deCossey, Winder & Associates. Peripheral service towers and a flexible plan.

**RIGHT:**
Laboratory tower plans from: the Agronomy Building at Cornell University by Ulrich Franzen, a projected science building at Barnard College by Vincent G. Kling and Louis I. Kahn's Richards Laboratories.
Laboratory Buildings:

Towers, rather than horizontally. Ulrich Franzen's laboratory tower at Cornell (page 183) also provides interior accommodation, with laboratories that can be entered either directly from the corridor, or through the offices. Vincent G. Kling's projected science building at Barnard College is a tower, as are, of course, Louis I. Kahn's Richards Medical Laboratories at the University of Pennsylvania. Kahn's first towers provide completely undifferentiated space, which can be used as laboratories, offices or corridors. The later towers have desk space around the periphery on some of the floors. The plans of both of these buildings are also illustrated on page 183.

College buildings tend to have more individual requirements built into them than industrial laboratories do. Hugh Stubbins' Physics Building at Princeton, shown on the opposite page, and the Science Building at Hollins College (page 182) are good examples. The Princeton building contains teaching and research facilities for both theoretical and applied physics, with careful attention given to the needs of individual faculty members. Compare the section of the Princeton building with the theoretical study on page 174.

The Science Building at Hollins College by Douglas Orr, deCossey, Winder & Associates, is a more specifically instructional building, with a clearly limited size, but considerable flexibility within the confines of the present building.

Some laboratories require experimental manufacturing or testing facilities in addition to desk and research areas. The research laboratories for Thomson-Houston at Bagneux, France show one way of associating laboratories with this type of space.

LEFT:

RIGHT:
Physics Building at Princeton University by Hugh Stubbins and Associates reflects requirements of individual researchers more than industrial facility would.
DISTRIBUTION OF LABORATORY SERVICES

Essentially there are two basic ways of bringing plumbing and air-conditioning services to the laboratories: horizontally and vertically. The epitome of a horizontal system is Louis I. Kahn’s Salk Institute for Biological Studies in San Diego, California. It has a mechanical floor, tall enough for a man to walk around in, contained within the structural system that spans each of the laboratory floors. These service areas are fed from vertical chases at the end of the building, so that the area devoted to mechanical distribution is actually greater than that devoted to research. The advantages of this arrangement are its almost complete flexibility, and its ability to permit extensive changes in one area, with the minimum of disturbance to other experiments. Flexibility on such a scale, however, is obviously expensive; and is by no means necessary in every case.

An unusually compact and consistent vertical system is used at Skidmore, Owings and Merrill’s Center for Space Research at M.I.T. Vertical chases on 36-foot centers carry the laboratory services and all of the air-conditioning, except for the unit air-conditioners along the window wall. As shown on the plan at right, the horizontal duct runs are kept unusually short. These service shafts are fed from a single mechanical distribution floor; and the chases are large enough so that they can be entered and serviced.

These two designs demonstrate the increasing proportion of laboratory

PLAN OF TYPICAL BAY

SECTION
space being devoted to mechanical equipment. The traditional means of servicing laboratory buildings are far less elaborate. The most typical method is probably the system shown in the first two sections on page 186, a compromise between horizontal and vertical modes of distribution. The corridor ceiling is used for the horizontal air-conditioning runs, because a corridor need not be as high as a laboratory. The vertical chases are spaced out along the corridor; they need not be large enough to enter, as it is possible to service them from the circulation space. Obviously, this is a simple and economical system, and one which still meets the needs of a great many buildings.

As mechanical needs, and particularly the air-conditioning requirements, continue to increase, the multiplicity of small, vertical chases begins to look less and less efficient. The fourth section on page 186 indicates one possible modification: a consolidated vertical chase running the length of the laboratory area.

Hugh Stubbins’ Primate Research Center for Harvard uses the columns to form mechanical chases, with horizontal runs occurring in the span-drels, but this building is not heavily serviced. The mechanical requirements of a typical laboratory seem to be moving closer to those of Caudill, Rowlett and Scott’s Olin Hall of Science at Colorado College, where the entire peripheral wall is a pipe chase. A more complete integration of mechanical and structural systems is possible in larger buildings with long spans, such as Caudill, Rowlett and Scott’s Science Building at the University of Miami. Both of the last two buildings have been published in the RECORD. (January 1965, pages 120-123).

LABORATORY FURNITURE AND EQUIPMENT

Considering the exacting requirements of scientific research, it is surprising how little specific information exists about the optimum nature of the scientist's working environment. The dimensional tables at right are the result of a comprehensive study conducted by Britain's Nuffield Foundation in 1960. They are based only on physical movements, but they do indicate that the widely accepted 10-foot module for scientific laboratories is very often not large enough. Not only does it produce uncomfortable working spaces, but it does not provide room for certain new types of laboratory equipment, particularly electronic instruments, which are frequently larger than the standard bench width.

Surveys of scientists tend to produce straight-line 45-degree-angle graphs: the bigger the module and the longer the bench, the better the scientists like it. However, it is possible to arrive at a minimum dimension appropriate for a particular client or discipline. For example, the firm of Smith, Smith, Haines, Lundberg, and Waehler established an 11-foot module for laboratories at the National Bureau of Standards, after building a full-scale mock-up with movable walls and letting the client examine the possibilities. Such an elaborate technique is only appropriate for a large job; but the choice of module is an important decision, and by no means to be taken for granted.

To achieve full utilization of space devoted to teaching laboratories, it is possible to make them convertible

LEFT:
Convertible teaching laboratories developed for Southern Illinois University by Hellmuth, Obata & Kassabaum, Inc. See ARCHITECTURAL RECORD, August 1963, Page 169.

RIGHT:
Minimum working dimensions in laboratories, from research by the Nuffield Foundation Division for Architectural Studies under the direction of Lord Llewelyn Davies.
Laboratory Buildings:

from one discipline to another. Hellmuth, Obata and Kassabaum developed convertible teaching laboratories for the University of Southern Illinois under a grant from the Educational Facilities Laboratories of the Ford Foundation. A plan, and some of the permutations, are shown on page 190.

Similar standardization is not possible in research laboratories, of course; but it is possible to systematize the choice of laboratory furniture by the use of a standard check-list. Samples of Skidmore, Owings and Merrill's check-list system are shown at left (top). These lists are an office standard; they are used by the client in selecting furniture, in the design of the laboratories, and in compiling the specification.

The familiar service strip running along the top of the bench tends to produce a fairly permanent installation of laboratory furniture. The trend today is towards more flexible arrangements. The Hellmuth, Obata, and Kassabaum teaching laboratory system places service runs in the floor with quick-connect couplings at predetermined points. The services are suspended from the wall in Hugh Stubbins' Primate Research Center, and are run inside a hollow-metal movable partition at Vincent G. Kling's Medical Research Laboratories at the University of Connecticut.

The theoretical scientist has been the forgotten man in laboratory design, but several recent buildings have made an attempt to surround him with a "creative" environment. The office towers of the Salk Center and the viewing balconies of I. M. Pei's Atmospheric Research Laboratories in Boulder, Colorado give the scientist full advantage of beautiful natural surroundings.

Laboratory Buildings:
PROBLEMS OF SHIELDING AND CONTAMINATION

Many types of modern research present a situation in which the experimenter must be protected from the consequences of his experiment; or the experiment must be protected from outside contamination. Sometimes both requirements occur.

Radioactive materials can require as much as twenty-four feet of shielding to protect the experimenter. As cranes are needed to move the large, heavy masses of concrete or lead shielding, the typical laboratory for such experiments becomes a high-bay space similar to areas required by industry. Special remote-handling equipment manipulates radioactive materials inside the shielding.

The illustrations at right reflect the capabilities of the Giffels and Rossetti office, which designed the shielding and the remote handling equipment, as well as the buildings.

The section at left, of the Franklin Institute in Philadelphia by Vincent G. Kling, shows a high-bay space integrated into a laboratory complex where the capability to perform many different types of experiment was required. Much work involving radioactivity, however, must be done in separate, isolated buildings.

Laminar air flow, a steady downward wash of air without air pockets or eddies, is used in the clean rooms of R.C.A.'s assembly plant in Lancaster, Pennsylvania designed by Vincent G. Kling & Associates (p. 196). It is the first use of this technique on such a scale, and gives a pre-vision of the possible requirements of the laboratory of the future.

Laboratory Buildings: Problems of Shielding and Contamination

LEFT:
At top, a diagram of the laminar air flow used in the clean rooms at R.C.A. plant in Lancaster, Pennsylvania designed by Vincent G. Kling & Associates. The diagrammatic plan shows the location of the rooms. System is considerably more effective than conventional clean rooms: no air-borne particles can be measured with conventional equipment at bench level and above. Area below bench is not critical, because of flow.
Industrialized Housing: A Reaction to European Approach and Methods

The problems of industrializing (prefabricating) public housing in the United States are 25 per cent technical, 40 per cent sociological and 35 per cent jurisdictional, in the view of one American manufacturer who attended the recent C.I.B. Congress for Industrialized Building in Copenhagen. George J. Santry, President of Schokbeton Products Corporation, says that in Europe production of industrialized components is considered necessary to provide public housing for a rapidly expanding population. Santry believes that the problems in the industrialization of housing in Europe are, by contrast, 75 per cent technical and 25 per cent sociological.

He reports that much of the public housing is inferior to middle- and upper-income housing from a construction standpoint. However the low-income housing has an attractive aspect because of the provision of large pieces of land for projects and the provision of parks, playgrounds and parking areas.

Case Histories On Ethical Problems In Engineering Practice

Ethical standards in the practice of engineering is the subject of two new publications sponsored by engineering society groups concerned with these matters. "Ethical Problems in Engineering" is a 250-page book covering 168 case problems. A variety of opinion is expressed since over 150 people commented on various of 139 cases. The problems are divided into groups according to the particular area of work, i.e., ethical problems of the consulting engineer, the engineer in industry, the construction engineer, and the engineer in education. Each of these chapters is introduced by a discussion of the nature of the problems in the field covered. This book, written under the sponsorship of the Ethics Committee of the American Society for Engineering Education, is published by John Wiley & Sons, Inc. at a cost of $6.50.

The second publication is "Opinions of The Board of Ethical Review," published by the National Society of Professional Engineers, containing 58 cases which are based on the Canons of Ethics developed by the Engineers' Council for Professional Development, supplemented by Rules of Professional Conduct developed by N.S.P.E. Additional opinions of the Board of Ethical Review are published on occasion in American Engineer. This volume is available for $1.50 (75 cents to members) from N.S.P.E., 2029 K Street N.W., Washington, D.C. 20006.

The Architect And New Materials

What does the architect look for in new materials? Architect Jack Train, of the New York office of Skidmore Owings & Merrill, listed four basic requirements in a talk delivered at the Conference on Cellular Plastics in Construction: (1) A complete and accurate account of each new material available; (2) A material that will fit within the manufacturing and installation practices of the present construction industry; (3) Products or materials that provide new or better solutions to the myriad of problems plaguing the construction industry; (4) Assurance that architects are not left alone "holding the bag" when new materials and products specified in good faith do not work out exactly as claimed by manufacturers.

Train went on to say that, "Some form of breakdown in communications between architects and manufacturers probably accounts for more wasted dollars and wasted product potential than any other item." He suggested that new materials be announced to the architectural profession in considerably more technical terms. Train said he felt that manufacturers are not often enough attuned to the building industry needs, but think they are, and thus develop products that are really not in demand. Train also said that, all too often, the manufacturer will recognize a general need and, in an attempt to meet it, will produce a product that fits his existing manufacturing equipment or technique, which, in turn, calls for certain compromises in the intended product. He may even hire an architect employee or consultant to assist him in his product design, but as long as he places manufacturing process ahead of final product, their services will be largely wasted."

The meeting was sponsored by the Society of the Plastics Industry, Inc. and the Michigan Society of Architect of A.I.A.

Sydney Opera House: The Engineer's Story

The progress of the Sydney Opera House has been described by British engineer, Ove Arup, as a battle, but not as one might expect a battle between architect and engineer, or even between designer and client, but a battle in which client, architect and engineer are banded together to translate architect Jorn Utzon's original design concept into the reality of a successful, and perhaps even a great building.

The story of the struggle to find a viable structural solution for Utzon's Sydney Opera House has been spun out by Arup in Architectural Design, March 1965. This article provides a very revealing study of the relationship of the engineer and the architect in a highly complex structural situation. In recent years many architects have taken the position that the best structural and the best architectural forms are necessarily identical. But the whole story of the Sydney Opera House is the story of
and cut off at different angles at the spine end. The geometry of the new structure is such that all the ribs are identical, although of different length and cut off at different angles at the spine end. Thus, the use of spherical surfaces—defined as those whose cross-sections are circles, which eliminates a stress concentration at the ends of the ribs—was the obvious choice. Utzon thought his original design was structurally reasonable. He was very disappointed when told by Arup "that the shape was not very suitable structurally" and joined forces with Arup to research other possibilities.

However, Arup says, "it soon became clear that any alteration to the cross-section which would eliminate some of the bending stress induced by self-weight would completely destroy the architectural character, the crispness and the soaring sail-like quality of the structure. To replace the sails with rabbit ears would be disastrous. And to make a dome-like structure over the whole of each hall or both halls, which would probably have been easier, was of course out. So in the end Utzon and I decided that the scheme had to go forward as designed by Utzon, more or less. It is one of those not infrequent cases where the best architectural form and the best structural form are not the same."

The next phase in the struggle was working out the construction of the concrete shells and here there seems to have been an almost infinite process of trial and error and of modification of original ideas. Originally, each shell was different, there was no repetition, and this made pre-casting very costly. After many months of testing, calculating and considerable "heart searchings," Arup tells us that "Utzon phoned from Copenhagen that he had solved the whole problem of pre-casting. It transpired that he had changed the whole shape of the shells by cutting each of them out of the same sphere. So now they are all spherical, and the ribs follow meridian curves on spheres of the same radius, 246 ft. That means that all the ribs are identical, although of different length and cut off at different angles at the spine end."

The geometry of the new scheme took about 18 months to work out and in Arup's words "without computers it would have been quite impossible. It is even necessary to use computers for the setting out of drawings, because we are working in three dimensions all the time. But the use of spherical surfaces certainly made the formwork simpler. There are about 2,500 concrete segments in the roof weighing seven to 12 tons each, and most of the forms for the rib segments, by far in the majority, can be reused 30 to 40 times."

In the course of the seven or eight years that work on the Sydney Opera House has been going on, Arup says that his firm alone has spent more than 375,000 man hours on the job and over 1,800 computer hours, and he evidently still does not feel that all their troubles are over... "the solving of and the calculations for the building process is by far the most difficult part of the job... and there is still ample opportunity for plenty of headaches to arise."

Whatever critics may think of the Sydney Opera House when it is ultimately completed, it undoubtedly represents a kind of creative collaboration between architect and engineer which is all too rarely seen; as Arup puts it "all that has happened on the job so far is structural engineering—and at the same time architecture."

Exposed Concrete Techniques

Portland Cement Association's Structural Bureau has issued a new group of information circulars on exposed concrete. Subjects covered in the circulars include: (1) Fiber Reinforced Glass Reinforced Plastic Forms; (2) Exposed Aggregate Plastic Forms; (3) Textures and Patterns from Plastic Form Liners; (4) Patterns and Designs (for jobsite precast concrete panels) and (5) Textures Produced by Various Form Liners.

New Concepts In Plastic Design For Multi-Story Frames

Late this summer Lehigh University presented a 10-day conference on Plastic Design of Multi-Story Frames which was attended by over 400 engineering educators and practicing structural engineers. Purpose of the program was to encourage the educators to introduce the new concepts of plastic design of multi-story steel frames into their curricula as early as possible, and to provide engineers with greater insight into the actual behavior of multi-story frames and plastic analysis techniques and design procedures.

Until now plastic design in steel has been limited in this country to one-story and two-story rigid frames and to continuous beams, because of the lack of experimental evidence and analytical tools. Plastic design, which recognizes the reserve strength in continuous structures, gives the structural designer a more realistic understanding of structural behavior. Savings over conventional (elastic) design are expected to be in the range of 10 to 20 per cent of un-fabricated materials cost.

The term plastic theory is derived from a phenomenon that occurs after a structural member exceeds the elastic limit (stress proportional to strain). In effect "plastic" hinges develop at points of peak bending moment. Upon formation of these hinges, moments are redistributed from the most highly stressed portions of a continuous frame to those carrying less stress.

Plastic theory now incorporated in building codes assumes that axial forces may be neglected. To extend plastic theory to multi-story frames, researchers had to find a way to compute secondary stresses due to side-sway and buckling deflections, and to calculate the reduction in axial load capacity of beam-columns.

Research in plastic design at Lehigh began in 1947. By the mid-1950's, plastic design methods had been formulated for one-story and two-story buildings.

The conference included lectures by members of the University's civil engineering department, and demonstrations of 10 structural load tests which included a full-size three-story steel frame.

Techniques to Improve Lighting Effects, page 199.
Product Reports, page 213.
Office Literature, page 215.
Good lighting must start off with the development of a proper lighting concept in architectural terms. In other words, the lighting scheme must suit the use of space in question. But once the concept is established, there are many different types of equipment and equipment arrangement that can be employed to achieve the desired result. How the lighting is handled in a technical sense will depend on a variety of factors which include the general character of the architecture, certain preferences of the architectural designer, surfacing materials within the room, height available above the ceiling for recessed fixtures, area of the ceiling and/or wall available for fixture placement, and, of course, cost.

There seems to be a widespread belief that good lighting is necessarily expensive. In fact the opposite is more often true; attention to lighting at an early enough stage in the planning process can actually save money. Knowledgeable fixture selection often makes a substantial difference to cost estimates, and the working out of lighting requirements before the building is designed can avoid later, frequently expensive, changes in position of power outlets, fixture location, type of fixture used, or even quite drastic redesigning. Sometimes requirements for flexibility can be met by simple variations in lighting rather than by more expensive architectural elements.

More positively, of course, good lighting, irrespective of cost, can vastly improve an architectural
When lighting a specular surface, such as polished marble, lamp image reflections cannot be eliminated but can be contoured so as not to show. For example, in Figure (1) the light shield must intersect the line RN to eliminate reflections beyond distance X. When the baffle is shortened as in (2), possible angles of reflection are proportionately higher; point G is considerably beyond the cut-off point R. When determining how to eliminate reflections from a cove, the angle of incidence is taken tangent to the light source with the source inside the angle. The lip of the cove must intersect both the angle of incidence and the angle of reflection (3). In (4) where the lip of the cove is too short, direct reflections will be seen as shown by angle STU. Where the cove is shallow as in (5), reflections are seen as shown by the angle JKL.

scheme, just as poor lighting can nullify good architecture. The full power of an architectural concept may never be realized because of such common errors as:
1. insufficient intensity
2. excessive brightness
3. too much contrast
4. lack of visual relief
5. improper treatment of specular surfaces
6. failure to highlight outstanding architectural features
7. selection of fixtures or quality of light inappropriate to the architecture
8. neglect of the relationship between daylight and interior lighting

In order to avoid these pitfalls and to create a meaningful lighting pattern within a building, it is desirable that someone in the design team should be well acquainted with lighting techniques and design details, as well as having a thorough knowledge of available fixtures and materials. He should also be aware of such things as the effect of light on different types of materials, and the ability of different kinds of lighting to produce variations in visual atmosphere. He must also, of course, coordinate such things as heat loads, power requirements, duct work and piping requirements with the electrical and mechanical engineers.

Importance of Early Planning
The importance of giving consideration to lighting requirements as early as possible in the design process can best be illustrated by a few examples. Very often insufficient space is provided in the ceiling to accommodate the lighting equipment needed to accomplish the design objectives. Often the deficiency is only a few inches but requires time consuming and expensive redesigning, or the use of specially modified fixtures before it can be corrected.

Another example is the treatment of the prominently featured marble wall, often placed in lobbies or at the end of a vista through a building. It is not enough for the architect to know that he wants to light this wall for emphasis, as there are many ways to light a wall, each of which requires a different set of ceiling conditions in

The lighting effect from these three fixtures would be exactly the same. Because of the cone-type shielding of the aperture, these downlights have a very low apparent brightness. But the architectural appearance of the ceiling would differ in each case. The unit at far left has no ceiling trim at all; the cone with the center unit has an accent trim; the whole downlight is below the ceiling with the unit at right.
Flexibility in terms of lighting effect can be achieved by using a lighting fixture which will accept several different lamps which, in turn, have different characteristics of distribution and wattage. The adjustable cone downlight illustrated could be used in a lobby in which exhibits, temporary booths or varying furniture layouts might be placed. Equipped with reflector flood lamps, the unit can serve as a low brightness downlight. Seating areas or counter spaces could be highlighted by using the narrower beam and more intense PAR flood lamps. Individual objects or displays could be accented by spot-type lamps, tilted to the desired angle. This kind of installation would maintain a clean ceiling and uniform pattern of fixtures, while providing for many different lighting situations.

The elegant, rather formal appearance of this lobby exhibition area is diminished by the unsightly lighting hardware protruding from the ceiling, which seems to have been an afterthought. Adjustable units capable of providing downlighting or accent lighting as required could have been used instead and would not have been visually disturbing to the architecture.

Black rather than white baffles were used with this luminous ceiling, thus establishing a relationship between floor and ceiling pattern. This otherwise routine treatment is a successful example of how special emphasis can be achieved through careful integration of lighting and architecture.
In this department store the high brightness of the ceiling and columns far exceeds the brightness of the merchandise, drawing the eye upwards away from the sales counters. Although the uplighting "enlarges" the space, downlighting should have been used with the uplighting to emphasize the sales counters.

The use of a luminous ceiling in this space produces a diffuse non-directional source of light, so that the elaborately sculptured wall is washed almost flat because of the lack of shadows. Angled, directional lighting focused on the wall would have brought the sculptured designs into sharp relief.

regard to depth, spacing from the wall and shielding from the sides. It is important to decide whether a specular or matte finish is required, and to be aware of the vastly different space and position requirements for each. The approximate color of the wall, whether it is to be lighted evenly, lighted in grade wash or splashed with a pattern of accented highlights must all be agreed upon before exact lighting specifications can be drawn up. If graphic material is to be placed on the wall, a decision must be made as to whether this should be highlighted or not. All of these wall treatments require specific allocations of space and power which should be determined before the area is detailed. If these decisions cannot for any reason be made at an early stage of the planning, then it will be necessary to develop a set of ceiling conditions which will allow for alternate solutions at a later date.

If factors concerning space are not known at the time of design, flexibility can be built in by the use of units which can accept a variety of lamps, which in turn can have different characteristics of distribution and wattage. The inclusion of dimming equipment also provides a means of variation and balance after installation.

Extreme contrast between indoor and outdoor brightness can create considerable discomfort. This problem can often be overcome by control of floor, wall and ceiling colors in conjunction with location of lighting sources, use of louvers, tinted glass and choice of window shapes.
WHAT BELONGS IN ACOUSTICAL SPECIFICATIONS

Part 2 (Conclusion)

By Ranger Farrell, Ranger Farrell and Associates

Part 1, in the September issue, dealt with points to be included in acoustical specifications on mechanical equipment. This concluding article covers sound transmission, sound absorbing materials, vibration, and lease writing.

Power Level versus Sound Pressure Level

An area in which there has been considerable misunderstanding of the responsibilities involved is the specification of noise levels of various pieces of mechanical equipment. Many specifications still being published are based on sound pressure levels to be expected in a room when a given device is installed. Such specification may either be on a frequency basis as discussed previously or equally often on an A scale sound level meter basis. Specifying the sound pressure level which will result in the room is analogous to ordering a furnace which will result in 70 degree temperature in the completed structure.

The manufacturer should not be expected to do the heat loss calculations which will permit him to know how many Btu's are required to achieve a constant 70 degree temperature. Obviously, one orders a furnace by its Btu output and the mechanical engineer is responsible for establishing the requirement based on his knowledge of the building construction, local outdoor temperature, etc.

The acoustical property analogous to the furnace Btu capacity is the acoustic power level and again it is the mechanical engineer's responsibility to establish from the power level what the final sound pressure level will be in terms of the room size, absorption, and any intervening walls, floors, mufflers, etc., between the noisy device and building occupants. We feel there is no rational justification for the specification of mechanical equipment noise on any other basis than that of the acoustic power level.

Sound Transmission

Specifications dealing with minimum acceptable sound transmission loss of various building structures such as partitions (fixed and folding), doors, ceilings, and floor constructions should be written only when large numbers of such dividers are to be used or when the divider is factory fabricated. For example, the partition used to surround mechanical equipment, a computer room, broadcast studio, etc., should be designed by the architect through the use of available literature or with the use of a consultant. The construction should be shown on the drawings and no indication need be given of the anticipated acoustical performance. On the other hand, if many similar spaces are to be separated by a given type of divider, say plaster on metal studs separating hotel bedrooms or movable metal partitions separating private offices in a large building, a specification is desirable, particularly if it requires submission of acceptable laboratory test data on an identical partition construction.

Another instance of a type of product for which acoustical performance specifications are applicable is in the area of doors and operable partitions. Here the purpose of the specification is two-fold: first, through the submission of acceptable test data, the manufacturer proves his ability to accomplish the desired end, and, second, through the requirement that a...
certain field result be achieved one gains assurance of proper installation in the field.

The effective method of specification of sound transmission appears to be as follows: In addition to the normal statement of the scope and limit of the specification, the specification should require one-half octave band sound transmission loss data obtained according to A.S.T.M.-E90-61T. This submitted report should give a description of the test facility and preferably the name of the facility.*

On the particular matter of measurement of sound transmission on doors for conventionally sized openings (as opposed to folding partitions or special custom installations) there appears to be no ideally suited test procedure. Probably the most effective method of tests is the A.S.T.M.-E90-61T test, wherein the test report clearly states that the door was in operable condition including all typical hardware. Unfortunately there are in the extant literature quite a few test reports on doors and panels sealed into the test opening. Since the effectiveness of the door gaskets is the prime determinant in the effectiveness of the door's isolation ability, sealed in place tests are meaningless.

A sound transmission path which, for a number of years, proved troublesome in many buildings was the path up through the suspended sound absorbing ceiling along the plenum and down to an adjacent space through its suspended ceiling. The manufacturers of acoustic tile who, for many years, have cooperated with one another through the Acoustical Materials Association, sponsored the development of the A.M.A. 1-2 room-to-room procedure. As a result, almost all manufacturers have had their product measured in the laboratory and published the resulting data in their own brochures and jointly in the Bulletin of the A.M.A. This is the only source of such information; however, it is reliable and completely acceptable as a basis of specification of proof of performance.

Rather analogous to ceiling ratings is a specialized problem of sound transmission through air diffusion devices when used as return air grilles in plenum return ventilating systems. The Air Diffusion Council (A.D.C.) has recently prepared a standard designated A.D.-63 which describes a test procedure almost identical to A.M.A. 1-2 and which gives a reliable indication of the seriousness of this sound transmission path.

There are only two independent laboratories capable of performing either A.M.A. 1-2 tests or A.D.-63 tests. These are Geiger and Hamme and the laboratory of Michael J. Kadars. It should be noted that the latter's facility is not yet suited to the measurement of sound transmission through partitions referred to previously, but will be soon.

**Sound Transmission Through Floor**

The rating of sound transmission through floors must be done in two ways. First, there is the question of rating it for air-borne sound transmission in which case tests can be conducted according to A.S.T.M.-E90-61T in either the National Bureau of Standards Laboratory or the Riverbank Laboratory. Unfortunately, because of the cost of installing floor constructions, relatively little data are available in the existing literature. However, the structural requirements often make necessary a ceiling so heavy that air-borne sound transmission is of relatively small importance. This is almost entirely true for typical occupancies when a suspended ceiling is utilized in conjunction with the floor. It is the present standard in multi-family dwellings, at least here. In the New York City area, to utilize 5 or 6 in. concrete slabs with a coating of plaster directly applied to the underside. It is important to note that this is not sufficient to satisfy all apartment dwellers.

The second way of rating floors is for impact noise. The only existing reference in this area is the Federal Housing Administration Bulletin No. 750 which describes a method of test and also one number rating. There is some question as to the correlation between the test results and the consumer satisfaction. Although it will do little harm to specify impact noise ratings using either frequency dependent data or the impact noise rating (I.N.R.) outlined in Bulletin 750, there is some question as to whether it will do much good. In the first place, the floor and ceiling construction is usually established by the architect and structural engineer rather than let out on competitive bidding basis where the bidder may substitute alternate constructions of his own conception. It would seem, therefore, rather than specify impact noise requirements it is best that the architect and his engineer simply check the noise rating of the construction and determine its acceptability on the basis of their own judgment.

**Sound Absorption**

It might be said that, in general, specifications have their greatest usefulness at a period in the history of building technology when a particular product or building system is undergoing rapid development. For example, in the early Twenties the use of acoustic tile in rooms was just coming into common and widespread acceptance. During the period in which acoustic tile was gaining acceptance, specifications stating minimum absorption requirements would have proven very useful.

As the industry has developed it has learned well how to provide sufficient and efficient sound absorption. As a result one can order any one of nearly 100 different acoustic tiles simply on the basis of appearance or some other non-acoustic criterion and assume that the product will absorb sound satisfactorily and adequately. This statement is made with particular reference to large areas of tile installation such as office buildings. Obviously, for special rooms such as auditoriums and broadcast studios, which must be individually engineered, writing specifications for material performance is not justified.

There are times, however, when it is desirable to specify minimum sound absorption requirements. An
Electrical transformers produce a humming noise with a peak at the frequency of the current. If the ambient noise is on the low side, the peak frequency will be heard over it. On the other hand, if the ambient noise is high enough, the sound will be masked. The acoustical specification covering transformers should take this phenomenon into account.

These graphs illustrate the masking of a different kind of noise, a printer's stapling machine, for example, which does not produce a steady noise but repetitive impact. Still the ambient must be high enough at all times to mask the impact.

example is a manufacturer who is introducing a new product and has made claims on its performance without benefit of acoustical testing. Another example is in the use of material which is subject to improper installation such as acoustical plaster.

Such specifications should require laboratory data issued according to Sound Absorption of Acoustic Materials in Reverberation Rooms, A.S.T.M. standard C.423-1960T at either Riverbank, Bureau of Standards, or Geiger and Hamme laboratories. Some acoustic tile manufacturers operate their own test laboratories and for the most part data from these laboratories are acceptable. Care should be taken to see that industrial laboratories have used procedures according to the C423-1960T standard.

Vibration Isolation Effectiveness
For the most part, the isolation of vibration to prevent "feelable" acoustic energy or vibration-induced noise must be accomplished by the mechanical engineer at the drawing board stage. There is no commonly accepted way, for example, of specifying the isolation efficiency of a flexible pipe connection, flexible electrical conduit, etc. As a matter of fact, about the only thing that one can specify is the effectiveness of the vibration isolation mounts themselves. Although the precise design and selection of the mount is a complicated function of the weight and rpm of the vibration source and the nature of the supporting construction, the following areas should be covered in the specification:

1. The isolation efficiency of the mount in its vertical direction should be covered. This is usually done by specifying the amount the device will deflect under the applied load of the vibration source. In addition, some indication of the type of mount should be made; i.e., steel spring, spring and rubber in series, rubber in shear, ribbed rubber pads, etc. In view of the prevalence of certain badly designed isolation mounts it is also important to specify that the stiffness in the two lateral directions shall be equal to or less than the stiffness in the vertical direction. Also, because of some poor installation practices it should be clearly
stated that the mounts shall be installed in such a manner that they will not "bottom" during either operation conditions or stopping and starting of the device. In those cases where high stopping and starting torques are generated by the device, rubber snubbers may be used to avoid metal-to-metal contact. These snubbers obviously will have a greater stiffness than other portions of the mount.

Lease Writing
The primary purpose of including lease clauses stating acceptable acoustical conditions in a rented space is, of course, satisfaction of the tenant. However, this satisfaction will actually be achieved only if the owner and his consultants provide suitable construction or equipment. Thus, the actual reason for writing acoustical lease clauses is that the design and engineering of construction and equipment which will affect the outcome within the "demised" premises is out of the control of the tenant. It is usually sufficient in preparing an acoustical lease clause to state the nature of the acceptable result, i.e., maximum acceptable noise or vibration levels without reference to the source of that noise or the means of isolation of that noise. For example, a lease clause stating that noises shall not exceed NC-35 within the "demised" premises hopefully protects the tenant from such things as a noisy tenant next door, noisy building mechanical equipment owned and operated by the owner, or even the passage of subway trains beneath the foundations of the building.

Unfortunately, the majority of lease clauses written today say little more than that the tenant shall occupy a space without undue noise or vibration. Specifically, such a broad statement though it may be satisfactory for problems in the extreme, will be subject to a broad range of interpretation if the problem is disturbing, but only marginally so.

Lease clauses have been prepared which cover both acceptable limits of noise and of vibration. To do this effectively one must have clearly defined criteria to tell us what people consider acceptable. With noise we believe we have such criteria.

These are specifically stated in the noise criteria or NC curves published by Beranek in Noise Control, Vol. 3, No. 1, 19-27, January 1957, and also in his book "Noise Reduction", McGraw-Hill Book Company, Inc. 1960. It is not sufficient, however, to merely state that the noise levels in the demised space shall not exceed some one of the NC curves. The applicability of the NC curves is limited to noises which are steady state (do not vary as a function of time) and broad band (do not contain tone components). As a result, in addition to the statement of maximum acceptable NC curves, it is also necessary to place a limit on the allowable time fluctuations of the noise (to cover such a case as an electrically driven stapling machine located on the floor above) and on the acceptable level of sounds containing strong tone components (to cover a problem such as that existing when a wall mounted transformer is adjacent to the premises).

The most effective way to limit noises of an intermittent nature would be to relate the acceptable level to the steady state noise from other building equipment or traffic. Unfortunately, the lessee cannot be expected to know what the actual ambient sound will be in all spaces of the building. For that reason it is probably more practical and will be more acceptable to the lessee if the limit of intermittent noises is related to the maximum acceptable steady state noise levels given in a previous section of the lease. For example, if steady state noises are restricted to NC-20 intermittent noises should probably be limited to either NC-25 or NC-30.

A similar approach must be taken with noises containing tone components. A restriction of this nature does not guarantee that sounds of these special types will be inaudible and in fact, if the steady state noises are well below the maximum allowable as stated in the lease, the intermittent sounds or those containing tones may be clearly audible. However, the response of the lessee in such a case would logically be—"It is not that I am making too much noise, it is that this space is abnormally quiet." The solution of such a problem should be in the hands of the tenant. The practical solution is, by one means or another, to increase the ambient noise to something below that he has stated he considers acceptable but which is sufficiently high to mask out the intruding sound.

Unfortunately, insufficient work has been done on "feelsable" vibration criteria. It would seem best not to attempt to require the building owner to meet vibration limitations per se. It would appear from what data are available that vibration levels sufficient to just induce uncomfortable feeling will generate noise far in excess of any normal reasonable requirement set forth in a lease clause as described above. There are, of course, some special areas such as the micro-analytic balance-room where special vibration isolation limitations must be imposed. Such special conditions are clearly the responsibility of the tenant and he must provide within his own equipment the required isolation measures.

The specification and the lease clause must be prepared specifically and individually for each project. It is also extremely desirable that the document be reviewed by all interested parties for general comment before it is accepted by any of the parties. By interested parties, is meant the acoustical consultant, the eventual tenant, any manufacturers involved, and, in some cases, by lawyers. Obviously the manufacturer of the product or the lessor may wish to see more tolerant numbers given but this judgment in the end must be made by the occupant who will have to weigh the cost of stringent requirements against the comforts gained thereby.

In conclusion, it could be said that a badly written acoustical specification or lease clause can almost do more harm than no such document. In the case of specifications, in an attempt to "play it safe" many specification writers have arbitrarily lowered permissible noise levels to the point where it is virtually impossible to achieve the stated condition. The result of this is that manufacturers simply toss the specification into the "old circular file" and bid on the basis of their standard product. In the case of lease clauses, loosely worded requirements are not defensible in court yet are so common that most leases are signed without any scrutiny of the clause. Thus, unless it is the intent to write a meaningful specification or lease, it is recommended that none be written.
Central signal station automatically controls these fire station doors—closes them 90 seconds after signal sounds.

For unfailing, emergency response rely on The "OVERHEAD DOOR".

When seconds can help save lives . . . fast, reliable door operation is vital—as critical as design flexibility and structural integrity to the functional plan. All sound reasons why The "OVERHEAD DOOR" continues first in architectural preference year after year. No matter what the closure need, our Architect Design Service can help you meet it with the versatility of The "OVERHEAD DOOR."

Automatic door controls to fit the precise need.
Industrial, commercial, residential . . . there's a dependable AUTO-MATE Automatic Operator to control any installation of The "OVERHEAD DOOR." Specific types include: remote control consoles, pull cords, pushbuttons, pull switches, treadles, time delays, interlocks, safety switches, time clocks, photo electric units, radio controls.

See Sweet's File 16-J for full details.

The New Russwin 2800 Series Door Closer
Ask Russwin how this one new door closer design fits every door 'n your building!

Russwin's new 2800 series door closer is designed for every door in your building — in function and in price.

With the new 2800 series, such features as back checks and delayed-action closing are optional — you decide the operating functions and cost level for each door. They are non-handed (except for fusible-link arm types). They mount conventionally or upside down. Inverted mounting permits more headroom for standard 6'8'' doors ... mounts on frames as narrow as 1 3/4'', keeps closers on the inside of exterior doors to protect them from the elements.

New 2800 series closers come in two handsome, durable cover materials: solid aluminum or solid bronze. Completely concealed latching and closing controls provide tamper-proof operation. Cast-alloy iron cases, drop-forged arms and full rack-and-pinion construction are standard.

For details on this exciting new product, see your Russwin supplier. Or write Russwin, Division of Emhart Corporation, New Britain, Conn.

Ask Russwin today . . . for better buildings tomorrow

ARCHITECTURAL RECORD  November 1965   209
"Uncommon" describes every aspect of Eggers' hardwood plywood manufacturing. Here the custom production of architectural plywood is a specialty. Achieving in beautiful plywood what the architect's creative mind visualizes calls for uncommon skill in interpreting a design, faithful adherence to specifications, and unusual ability in attaining beauty of grain and finish. Eggers custom craftsmanship experience — which began in 1884 — proves that the beauty and warmth of wood is only the starting point in producing distinctive paneling. Vital to final appearance are the skills required to expertly match face veneers . . . to provide perfect finishing that reveals species texture and color . . . to achieve precisely the effect you want. These demand uncommon, custom craftsmanship. This is Eggers' specialty. This is seen in distinctive installations all over America where doors match panels, transoms match doors, panels match panels (in heights up to 16 feet); and in a wide range of office furniture, dividers, table tops and other applications — wherever beautiful plywood is used. This is your assurance that whatever your mind visualizes for your next project, Eggers can produce it — with uncommon excellence. Write for our Plywood Catalog for Architects.

Eggers Plywood Company, Two Rivers, Wisconsin, Phone: 414-793-1351

A GUIDE TO THE USE OF ACRYLIC PAINTS

By Gerould Allyn*

Part 1 of this article discussed the history, development and characteristics of water-based paints with emphasis on the properties of acrylic emulsion latex paints.

SURFACE PREPARATION

Masonry Surfaces

For best results, slightly different surface preparation is required for each of the primary types of unpainted masonry surfaces, such as concrete, stucco, asbestos cement shingle and concrete block. Problems encountered with these substrates usually stem from their alkalinity, porosity and surface texture.

Cracks and holes in new or previously unpainted stucco concrete or stone should be carefully patched, and the patches allowed to dry. Recently poured concrete may have an oily surface from curing compounds and the patches allowed to dry. Repairs for removing mildew include scrubbing with a solution of sodium hypochlorite (bleach) and trisodium phosphate, steam cleaning, and sandblasting.

Penetrating type surface conditioners have been used successfully on chalky surfaces. They penetrate the chalked layer and bind it to the underlying masonry. They require several days for drying before topcoats can be applied.

Efflorescence present on either old or new masonry surfaces should be removed by washing with a 5 per cent solution of hydrochloric acid and rinsing thoroughly with clean water. Mildew should also be removed before paint is applied. Methods for removing mildew include scrubbing with a solution of sodium hypochlorite (bleach) and trisodium phosphate, steam cleaning, and sandblasting.

It is risky to repaint masonry surfaces previously covered with cementitious coatings, lime or white-wash because these coatings continue to deteriorate under new paint. The result is reduced adhesion as time passes, even though good adhesion appears to be obtained initially. Although satisfactory service has been obtained over such surfaces with 100 per cent acrylic emulsion paint, problems and failures frequently occur.

These chalks often contain materials which are not efficiently wetted by water and tend to crumble or lose adhesion readily. Such surfaces have very high water demand, leading to excessive wicking and premature drying of the paint film. Pre dampening or dilution of the first coat of paint often improves penetration. However, it is best to remove old coatings before repainting.

Wood Surfaces

Wood has a number of characteristics potentially detrimental to the performance of a paint. Its non-uniform dimensional variations, its tendency to pick up moisture and the resulting problems of grain cracking and blistering have been mentioned. Other problems which adversely affect the coatability and appearance of the paint system include knots, pitch pockets and various extractable color bodies such as saps, tannins and resin.

Based upon the particular problems associated with painting them, the common soft woods used for building siding and trim are generally classified as either grain-cracking or staining types.

The grain-cracking woods include the firs, spruces and pines. Among the grain-cracking woods, yellow pine gives the greatest difficulty. Paint durability is poorest on board where the grain is non-uniform or in flat-grain pieces. Coatings on grain-cracking woods must combine superior flexibility and outstanding adhesion.

Cedar, southern cypress and redwood are staining-type woods. Their fine, uniform grain, more regular expansion and contraction, improves paint durability. However, they contain both water and oil-soluble extractives which may migrate to the surface and stain through the primer. Unless primers contain inhibiting mechanisms for precipitating stain extractives, stain bodies will migrate outward through successive topcoats.

The importance of the prime coat is well recognized. And until recently, most paint manufacturers continued to recommend oil based primers...
ers for bare wood surfaces. However, oil based primers have certain shortcomings.

Because they cure by oxidation, oil paint films lose flexibility and become brittle with age. This permits little dimensional fluctuation and cracking is a common form of failure in old oil-paint film. Oil paints adhere badly when applied over damp substrates. Blistering is another source of trouble. Also, during the two or three days oil primers must dry before top coating, they are subject to dirt collection, mildew or the damaging effects of dew or rain.

Within the past several years 100 per cent acrylic emulsion latex primers have been developed for both non-staining and staining-type woods. Thus the ease and speed of application provided by acrylic top coats is now available for the entire paint system. Normally the primer coat dries in less than an hour and top coats can be applied the same day, often without moving scaffolding. No solvent is required, and cleanup is swift and convenient.

It is a misconception that applying any water thinned paint directly to bare wood leads to warping, splitting or cupping. Properly formulated 100 per cent acrylic emulsion primers give excellent protection against these faults. Some paint manufacturers modify synthetic emulsion paints with oils or alkyds to produce an all-purpose primer, although this is unnecessary if the correct acrylic emulsion is used.

Surface preparation of new wood surfaces is basically a problem of selecting the proper primer if the surface is clean. Repainting of wood surfaces poses greater problems in surface preparation depending upon the condition of the old paint film. Adhesion is the primary problem encountered when repainting gloss paint and aged but unweathered surfaces which are often found under eaves and in other protected areas. To attain maximum adhesion and durability, these surfaces should be cleaned of dirt and mildew. Glossy or oily deposits should be removed either chemically with solvent type cleaners or physically with sandpaper. Iron nailheads should be counter sunk and putted or primed with an oil paint before an acrylic paint system is applied, to prevent rust from bleeding through the top coats.

Performance of new paint over chalky surfaces depends upon the type and degree of chalk, and weather conditions at the time of application. The degree of chalk is particularly important because of chalk's water demand which extracts water from the new paint causing the film to form on the surface rather than penetrating to the substrate. Therefore, as in the preparation of chalked masonry surfaces, the surface should be prevetted and water-based paint applied to the damp surface.

Weather affects the drying speed of paint. Low humidity, dry breezes and direct sunlight can cause premature film formation and reduced penetration. This can be minimized by the proper surface preparation including prewetting.

As sound a surface as possible should be re-established by scraping, and by putting and priming of exposed nailheads. If the exposed surface is bare wood, primer should be used before applying the top coat.

Mildew should be removed from wood surfaces in the same manner as from masonry surfaces.

Knots in wood are a problem for two reasons. First, they may become loose and rupture the paint film. Secondly, they contain high concentrations of tannins which stain. Shed-lacking helps to contain tannin and prevent staining if the knot does not move and break the shellac film. Only removal of the knot can guarantee tightness.

Interior Surfaces
Sealers and primers are especially important on wallboard, plaster, concrete, stucco, brick and similar materials which have high absorption properties and are also alkaline.

The water and solvent resistant properties of the acrylic emulsions are particularly useful in undercoats as they do not soften or lose adhesion when recoated. Primers and top coats can be applied the same day without moving scaffolding. Practically any type of coat, including water based paints, oil paints, enamels, varnishes and lacquers, can be applied over acrylic emulsion base coats. The pigmented primers provide excellent sealing over fresh plaster, cement, cinder block and wallboard.

Although previously restricted to flat paints, one acrylic emulsion has recently been developed with which semi-gloss interior latex paints are now being produced. These paints can be applied over glossy surfaces and provide all the advantages of other acrylic emulsion paints as well as better scrub resistance and stain removal characteristic of enamels.

Other Materials
Asphalt shingles, and asphalt roll roofing have been coated successfully with pastel colored or white acrylic emulsion paints. These light colored paints reflect a large percentage of sunlight and therefore reduce indoor temperatures in hot climates. Since water is used as the thinner rather than a solvent, asphalt bleed-through is not a problem.

One of the increasing variety of substrates which are being coated with 100 per cent acrylic emulsion exterior paints is galvanized iron. As acrylic emulsion paint films are flexible they expand and contract with the metal through temperature changes. For best results, the acrylic paint should be applied to bare metal. The surface of most new galvanized metal has been treated to prevent "white rust". To insure maximum paint adhesion this coating should be removed before painting. Wiping with mineral spirits is sometimes helpful. An alternative is to permit the metal to weather for at least six months.

Specifying Paint Systems
The following references might be helpful in drawing up painting specifications:

"A Guide to Modern Painting Specifications," published by the Painting and Decorating Contractors of America, outlines specifications for three types of jobs—standard, premium and minimum. Designed to help the architect prepare sound specifications in order to obtain fair and meaningful painting bids, it will help insure that all aspects of the job are covered.

Federal Specification TT-P-0019B specifically covers the use of exterior acrylic emulsion paints on exterior masonry surfaces. A similar specification for exterior wood surfaces is being prepared but has not yet been published. The U.S. Army Corps of Engineers publishes a Paint Manual for Civil Works and Military Construction which is available from the Office of the Chief of Engineers.
STEEL SPACE TRUSS FOR FLEXIBLE SCHOOL BUILDING

The Bertha Ronzone elementary school in Las Vegas, Nevada, is the first school building to be completed using the new Space Grid component system. This long-span system allows a high degree of interior flexibility; use of movable partitions makes possible constant and easy adjustment of room dimensions while the elements of the physical environment—heating, cooling, ventilation, light and sound—can be varied to match the requirements of the flexible arrangement of space. Ducts and light fixtures can be shifted due to the open, modular design of the framework. The Space Grid system meets the principles developed by the School Construction Systems Development Project, a program sponsored by the Educational Facilities Laboratories to improve the quality, speed and economics of school construction.

Space Grid is a steel space truss which defines both the roof line and the ceiling plane. A three-dimensional grid, it is composed of space pyramids, each one 35 in. in depth with a 5 ft by 5 ft base. The pyramids are joined at the base to form the desired bay length, and connected at the apex with a steel chord. A series of these space trusses, assembled in parallel, constitutes the overhead bays and forms a secondary structural system. Trusses arrive at the site pre-painted in correct lengths. A system of roof beams and columns provides the primary structural support. The system is expandable on all sides, and the company claims that the basic structure for a Space Grid school of 150,000 sq ft can be delivered and erected in about six weeks.

The inside of the space truss forms a "mechanical envelope," which houses lighting coffers, heating-cooling-ventilating ducts, return air plenum and electrical raceways in a readily accessible overhead location.

The lower chords of the space truss are separated by a 1-in. slot, which accommodates air diffusers, permits return air to enter the plenum above, and also forms the ceiling connection for wall partitions. Butler Manufacturing Company, Kansas City, Mo.

J&L lightweight structural steel used by Holston Steel Structures, Inc., Bristol, Tennessee, reduced the steel weight in the composite crane and building columns by 26 tons.
You don’t have to “put up” with J&L lightweight structurals just because everybody else does

We can give you some much better reasons.

Putting up a building with J&L lightweight structurals solves a lot of architectural and construction problems. More important, it prevents them. That’s why you’ll find them used so widely, wherever you go.

Light weight means minimum dead loads, therefore important savings in structural support and foundations. It also makes possible faster, easier construction, requiring less manpower ...

Flexibility? J&L lightweight structurals are available in high strength grades, too, so you can choose from several carrying capacities within each beam size.

Simplicity? There are fewer pieces to handle when you use maximum length lightweight structurals as continuous members. And simplified end connections keep fabricating requirements to the barest minimum.

Versatility? Architects enjoy an unusual degree of design freedom when they work with J&L lightweight structurals, since they are compatible with other building materials.

Check into these and other advantages of J&L lightweight structurals. When all the facts are in, we’re sure you’ll “put up” with nothing less!

Florida race track grandstand roof, designed to withstand 72 lbs. per sq. ft. uplift, uses J&L lightweight structurals provided by Peden Steel Company, Raleigh, North Carolina.

Holiday Inn Jr. Motel, Memphis, Tennessee, has a J&L lightweight structural framework to resist deflection both for cantilever loading when in place and for over-the-road hauling.

These exposed J&L lightweight structurals, fabricated by Ray Steel Company of Fort Worth, Texas, for the Eagle Mountain-Saginaw Junior High School blend in with the interior decor.

Here's the proof in waterproof FOAMGLAS®
The only roof insulation that can keep the aquarium from watering the cactus

We named it an aquaterrium. An aquarium on one side...a terrarium on the other. It may be the only one in the world. We built it to demonstrate that Pittsburgh Corning's FOAMGLAS cellular glass insulation is absolutely waterproof.

FOAMGLAS will never let the water through to drown the cactus. A cactus doesn't like water...and neither does your insulation.

Once your FOAMGLAS Roof Insulation is down, our 20-year guarantee protects your client. We can make that guarantee because FOAMGLAS stays dry and always keeps its original insulating efficiency. FOAMGLAS permeability (moisture absorption) is zero. No other roof insulation makes this claim.

A new feature of FOAMGLAS®-BOARD roof insulation is the small bevel on each 4' bottom edge of the board. These beveled edges provide a vapor pressure escape channel for moisture trapped between insulation and deck. The elimination of pressure build-up reduces wrinkling and blistering of the roofing.

Investigate the only waterproof roof insulation...available in 2' x 4' bevel edge FOAMGLAS-BOARD in thicknesses of 11/2", 15/4" and 2".

Pittsburgh Foamglas® cellular glass insulation is manufactured and sold in Western Europe by Pittsburgh Corning de Belgique, S.A., Brussels.

WINDOW CLEANING PLATFORM FOR DIFFICULT CORNERS

An ingenious window cleaning device for use on buildings with inaccessible, recessed corner windows, consists of a main platform to which an auxiliary platform can be added at right angles. To prevent the main platform from tipping due to the off-center weight of the added platform and workers, a counterweight was designed for attachment at opposite ends of the main section, as shown in the diagram. The auxiliary plat-

form and the counterweight are interchangeable end for end, making it possible to work around right-hand or left-hand corners. Both can be easily attached by means of four stainless steel pins. The unit was first developed for the Ferre building, Miami, Florida, where compatible hoisting equipment and safety features were also devised. Mayco Crane Corp., Los Angeles, Calif.

This is 3M's new Tartan® Multi-Use Surfacing...

RESILIENT: Provides cushion for falls, protects against shin splints, leg fatigue and body shock. Constant under all conditions.

DURABLE: Withstands extreme wearing conditions; impervious to spikes, cleats, high heels, even heavy machines and vehicles.

ALL WEATHER: Surface conditions and resilience remain constant regardless of rain, cold, heat. Non-slip wet or dry.

LOW MAINTENANCE: May be cleaned with broom or rinsed with hose. Never needs varnishing. Causes no dust or dirt.

An incredibly durable material. Sound-proof, resilient and non-slip underfoot. Can go indoors or outdoors; resists abrasion, chemicals, soiling and weather extremes; requires minimum maintenance; can be pre-fabricated to almost any dimension or custom-installed on the site. Available in several colors and surface textures. Refer to our catalog in Sweet's Architectural and Industrial file. Or write or call for information.

SUSPENDED HYPERBOLIC PARABOLOID—Believed to be by far the world's largest of its type, the circular saddle-type roof of the Arizona Veteran's Memorial Coliseum at Phoenix boldly spans a column-free area of 119,500 square feet, giving an unobstructed view from all 15,000 seats in the arena. The roof structure consists of a reinforced concrete compression ring of 380' diameter with a 10' x 10' gridwork of Ryerson post-tensioning tendons strung across its center. Precast panels are hung on the tendons and the spaces between them filled with grout. The north-south tendons sag 33' from ends to center. East-west tendons rise 5' from ends to center and serve as tie-downs to overcome aerodynamic lift. Tensioning to a range of 462,000 to 544,000 lb. was applied in stages before, during and after grouting. Management and Operations Consultant: Emmett Race. Architects and Engineers: Associated State Capitol Architects; Lecher & Mahoney; Place & Place. Consulting Engineer on roof structure: T.Y. Lin & Associates, Dallas, Tex. General Contractor: Manhattan-Dickman Construction. Arizona State Fair Commission.

ANOTHER OF THE WORLD'S LARGEST CLEAR-SPAN BUILDINGS—the Seattle Center Coliseum, also makes use of post-tensioning by Ryerson. Four triangular steel trusses and a post-tensioned concrete edge beam form four hyperbolic paraboloids and support a two-way system of tensioned tendons. These tendons provide rigid support for aluminum panels that cover the 400-foot square roof. Architect: Paul Thiry. Structural Engineer: Peter H. Hostmark and Associates. Contractor: Howard S. Wright Construction Co.
PROVE THE POINT...

BBRV POST-TENSIONING BY RYERSON

• minimizes support requirements
• maximizes freedom of design
• at reasonable cost

LONGEST SINGLE SPAN FOLDED PLATE ROOF is a distinctive architectural feature of the Physical Education Building at Indiana State University in Terre Haute. Longitudinally the span is 160' between support points with a 3' overhang at each end. In the transverse direction each of eight segments has a horizontal span of 26' and a vertical rise of 11½'. Each side of each segment is post-tensioned by six Ryerson tendons.

Architects: Ewing Miller & Assoc. • Architectural Designer: David J. Field.
Structural Engineer: Homer Howe • Contractor: J. L. Simmons Co.

CANTILEVERED HYPERBOLIC PARABOLOID—The dramatic saddle shell roof of Edens Theatre at Northbrook, Ill. (also probably the largest of its type) stretches 159' between working points at abutments; 221' from tip to tip. The entire shell (only 4" thick) is rotated about the abutment points so that one tip is 50½' above floor level; the other only 30½'. Vertical Ryerson post-tensioning tendons prestressed the abutment walls, and these rest on post-tensioned foundation pads. To absorb horizontal thrust, the pads are connected by a post-tensioned tie beam.

Architect: Perkins and Will • Engineer: The Engineers Collaborative.
Contractor: Chell and Anderson.

GRACEFUL SWEEP OF THIS THIN-SHELL DOME spans 268' and covers an auditorium seating 7200, with provision for a balcony seating 5000 more. Yet, cost of structural elements was only $178,000 and total building cost only $8.50 psf. The concrete dome, cast on the ground and lifted into place, is circled by a tension ring in which twelve Ryerson post-tensioning tendons of 40 wires each supply a force of 720,000 lb. Warner Auditorium for The Church of God, Anderson, Indiana.

General Contractor: Lewis Construction Co.

STRUCTURAL STEEL POST-TENSIONED—contributing to the eloquent forms of this structure is a less common use of post-tensioning. The WF beam tension ring (which resists the horizontal thrust of 32 big triangular steel space trusses supporting the dome) is circled by 8 Ryerson post-tensioning tendons. These are anchored at staggered points so that a complete ring, 4-tendons deep, exerts a force of 400 kips, with 300 kips more in reserve for live load. Result: Weight of the WF ring beam could be reduced by two-thirds and, of course, supporting structure also lightened. St. John Brebeuf Church, Niles, Illinois.

General Contractor: Valenti Builders, Inc.
Steel Subcontractor: Pittsburgh-Des Moines Steel Co.

If you would like more information on Ryerson post-tensioning service or help on a current project, call your nearby Ryerson plant or write Box 8000-A, Chicago, Illinois 60680.

Over one hundred Rust-Oleum Factory Engineers work closely with architects all over the country. But, they don't stop there. They follow the job down the line. They work with the fabricator, the contractor, the painter. They see that the right Rust-Oleum system is used and that it is applied correctly. The Rust-Oleum man who was working with you on coating specifications yesterday may well be working with a painter on the job-site the next day. The Rust-Oleum man knows his business. He follows through at all levels. We call this DEPTH SERVICE... a service that very few companies are qualified to render.

Rust-Oleum is available in many specialized systems and in many attractive colors. It beautifies as it protects tanks, structural steel, towers, bridges, steel sash, machinery, equipment, etc., throughout industry and municipality. Your nearby Rust-Oleum distributor maintains complete stocks for immediate delivery.

Write for brand new Rust-Oleum Specifications Guide. Request Form No. 6408 at no cost or obligation.

There is only one Rust-Oleum. Distinctive as your own fingerprint.

who'd of thought of making a restaurant out of awnings? Glen Raven did
with Sunbrella®. The fabric that’s limited only by your imagination.
To prove the point, Glen Raven commissioned a noted San Francisco design firm, Donald Clever, Inc., to develop a completely new, workable building concept utilizing the unique advantages of Sunbrella Acrilan® outdoor fabric.

The result is this revolutionary Pup Hut, an all-Sunbrella, all-weather restaurant using removable steel-framed panels of Sunbrella for everything—from the dramatic pyramid roof, side walls and signage to the sun blinds, director chairs and decorative motifs. (See next page for complete working drawings.)

Mr. Clever found that, “Sunbrella makes it possible—and practical—to design a construction system using awnings as an extension of the architecture of the building, rather than the conventional way when the awnings are an applied element, often unrelated.” This restaurant design is the property of Glen Raven. We invite you to use it. No fee.

And what are the unique advantages of Sunbrella that make this revolutionary idea practical? And an economical investment?

Sunbrella fabrics are woven of 100% Acrilan®, the Chemstrand Company’s high-performance acrylic fiber, guaranteed for five years from date of installation. They can’t crack, peel or rot—even if you leave them up all year, even if you store them damp.

They’re unaffected by air-borne chemicals; the performance features and durability will not be affected by mildew in any climate. They won’t shrink, or wrinkle. They breathe, keep air 22% cooler underneath, increase air-conditioning efficiency. And the clean, fresh Sunbrella colors and patterns—all 37 of them—are solution-dyed.

Whenever you have something new, or novel, or different to do outdoors, use Sunbrella. There’s no limit to what your imagination can do with it.
STEEL WORK

Steel: Furnish and install plates, steel shapes, bolts, screws, etc., as shown on the drawings and as necessary for the job. All steel work excluding 5/8" diameter tubular frames to be fabricated from hot rolled steel, to sizes and shapes as shown on drawing.

Shop Drawings: Submit complete shop drawings for designer's written approval before commencing fabrication.

Workmanship: To be best practice in modern structural shops.

Welding: To conform to American Welding Society.

Channels: All channels to be shop welded to form continuous grid with flanges at intersection points cut away to allow for insertion of 5/8" diameter tubular steel frames, and to form a continuous gutter. All 5/8" diameter tubular steel framing to be cadmium plated steel, and to be consistent in overall size and shape. Diamond shape may be formed by crimping.

Roof: The roof shall be fabricated in four basic triangular grids, with the perimeter 6" x 13" JR and the four 2" x 2" x 1/4" LSL bolted together. The triangular grids will then be secured into place on the frame with non-corrosive stainless steel bolts. If this structure is supported by posts, use one 4" x 4" x 5/8" WF at each corner connected with angle brackets bolted to 6" JR.

All bolts and metal screws shall be non-corrosive stainless steel with countersunk heads.

ACRILAN® PANELS

Fabric: All fabric panels to be Glen Raven Sunbrella awning fabric, made from Acrilan® Acrylic Fiber. It shall be stretched fully taut and smooth and securely fastened to the 5/8" diameter tubular steel frames. Each panel to have one stitched seam on the longest diagonal.

Roof Cap: Roof cap shall be of 1/2" x 2" x 4" clear Plexiglas with corners cemented together to form water-proof joints.

PAINTING

Surface Preparation: All metal shall be thoroughly cleaned, degreased, etched and dried before painting. All steel work is to be completely shop painted with 3M Velvet Coating before erection and touched up as required after erection.

Primer: To be suitable for alkyd enamel top coat, i.e. DuPont 63 or 65 Line Air Dry or 828 Line Baking Primer or approved equal. Primer to be thoroughly dry before application of 3M Velvet Coating.

Finish Coat: Finish coat shall be 3M Velvet Coating by the Minnesota Mining & Manufacturing Company. Their printed instructions shall be followed at all times.
You can find exactly the doors you need — whatever the performance requirements — whatever the glass or louver treatment — in the complete line of Republic Standard Stock Doors. What's more they're available from a network of warehouses — on overnight shipment in most cases.

- For architects this complete line of doors — with its wide range of styles, heights, widths, thicknesses and applications — means almost unlimited design freedom.
- For the builder the convenience of fast shipments means fewer job delays, no wasted time or money.
- For the owner, selecting from the Republic line of standard doors means assured performance in place, at the outset and over the years.

Leading the Republic line of Republic Standard Doors is the new IMPERIAL — setting the pace for appearance and function. This trim, handsome Full Flush Door fits any interior. It is so versatile that any Flush Panel IMPERIAL Door, with a glass frame section and snap-in glazing bead provided, adapts quickly and easily to any glazing or louver treatment. It's reversible, too. "No handing." Available in standard widths up to four feet.

To extend your range of choices, Republic also provides Flush Panel Doors of style and panel construction in Series 50, 1 1/8" thick and Series 57, 1 3/4" thick. They're available in a full variety of leaf designs and glass sizes.

All Republic Doors are designed for service and durability, built to hang square and stay that way in heavy use. Sturdy, heavy gage steel construction means no sag, bind, warp or split — ever. Exterior surfaces are rust inhibited with a five-step phosphatizing process. Protected and prepared for painting with a baked on prime coat, every Republic Door is individually packaged to ship, stock and deliver in perfect condition.

A network of Republic warehouses waits to serve you ... in most cases overnight. Call or write for a complete catalog or for answers to your specific questions.
INNER-SPACE MISSION

First of 400 Lennox 16-ton DMS cooling units being installed on prototype building of Ford Foundation SCSD project in California.
It's the new frontier in climate control.

Heats, cools and ventilates simultaneously.

Provides up to 12 separate zones with 12 different climates.

Flexible ducts that permit walls to be moved.

A rooftop unit, of course.

It's the Lennox Direct Multizone System.

Designed with flexible ducts to permit schools to move walls around.

But available with fixed ducts for any commercial application.

It filters and ventilates continuously. Cools free at any temperature under 57°.

Gas, hot water or electricity fuel it. It is remarkably inexpensive to install, maintain, operate.

Designed for the School Construction Systems Development project, it is being enthusiastically received nationwide.

Sixty-eight units are being installed in a single Nevada school district! But, it is uniquely ideal for any building where design or occupancy demand multizone control.

Write for literature to Lennox Industries Inc., 468 S. 12th Ave., Marshalltown, Iowa.

WALLPLATE AND GROUNDING CAPS
A new weatherproof plate for tap/on-tap/off switches has been added to the company’s line of weatherproof devices. The neoprene plate fits standard weatherproof or FS box mounting, and is said to be unaffected by grease, oil, hot water, live steam, etc. An internal steel reinforced plate gives reinforcement to the neoprene.

Four new heavy duty caps have been added by Slater to their line of power outlets and caps. Catalog models 3861 and 3867 are both of the universal type and are assembled with 30 ampere “L” shaped ground prongs. For 50 ampere devices, a flat ground prong is also furnished to replace the “L” ground prong. In the 60 ampere types, Catalog model 3865 is rated at 250 volts, and model 3866 at 125/250 volts. Slater Electric Inc., Glen Cove, N.Y.

the most exciting ideas take shape in plywood
Fourteen petal-shaped plywood components roof this drive-in bank that blossoms by a busy Detroit highway. It's another case where only plywood could reconcile a demanding design with a tight budget. Concrete was considered but would have cost twice as much. The conical plywood panels were so lightweight and so carefully engineered that they took only three days to install. Whenever your designs call for unusual shapes, high strength and low cost, look into plywood components and structural systems. For more on DFPA plywood, write us at Tacoma, Wash. 98401 (US only).
New Bostwick H. P. Terminal*

GIVES A "FINISHED FACE" TO PARTITIONS-HEADERS-JAMBS

Bostwick Hollow Partition Terminal provides a ready-made steel face to headers and jambs of openings in hollow steel stud partitions and gives a finished, neater look to plastering jobs. When used with Bostwick Channel-Form® Steel Studs, you can finish off partitions 3¾", 3¾" and 4¼" thick. Easy and faster to install. No corner bead needed! Save money! Save time! Save plaster! Custom-made to job sizes and lengths with face of bonderized electrolytic galvanized steel welded to galvanized perforated and expanded double wings. Better investigate Bostwick H. P. Terminal today. Her dreams will be the realities of tomorrow—sleek, shiny birds will aim at the moon and cars will whisk her from city to city on cushions of air.

But dreams and children alike must have the proper atmosphere to thrive. Freedom and stability provide this. It is our task to foster this atmosphere in the present and protect it for the future. We have an investment in it for our children.

You can protect this investment by joining with other leading American businessmen to promote the Treasury Department’s Payroll Savings Plan for U. S. Savings Bonds. The Treasury’s plan works for stability in our economy and strength in the defense of our liberties.

By fostering the love of individual freedom and the economic well-being of the nation, it provides a strong, steady foundation that will not waver under the challenges of tomorrow.

When you bring the Payroll Savings Plan into your plant—when you encourage your employees to enroll—you are investing in the dreamers of our today. In the engineers, scientists and teachers of our tomorrow. In America’s future. In freedom itself.

Don’t pass this investment opportunity by. Call your State Savings Bonds Director. Or write today directly to the Treasury Department, United States Savings Bonds Division, Washington, D. C., 20226.

in your plant...promote the PAYROLL SAVINGS PLAN for U.S. SAVINGS BONDS

The U.S. Government does not pay for this advertisement. It is presented as a public service in cooperation with the Treasury Department and the Advertising Council.
Free light for the world's biggest building
Hetron-based hurricane-proof panels let daylight into 129,482,000 cu. ft.

A hurricane tearing along at 125 miles an hour won't shatter these Hetron-based translucent panels. Neither will shock waves set up by rocket launchings at nearby Cape Kennedy.

That's why the architects chose them to let light into the vast interior of the Vehicle Assembly Building.

The big 4 x 12-foot panels are reinforced Hetron polyester resin laminated to aluminum grids. Their fabricator says they "are the strongest ever built." Coated with Tedlar,* they are expected to resist the brilliant Florida sunshine up to six times as long as standard panels.

No glare. You can specify Hetron-based panels for high, medium or low light transmission. Whether you let in a flood or a trickle, it is light without glare and only the softest of shadows.

No flame. Panels made of Hetron polyester resin can't spread a fire. Typically, they test within a range of 35 to 75 in flame-spread rating by VL Tunnel Test. They are qualified to carry the Factory Mutual seal of approval and the U/L label.

We don't supply these strong, weather-resistant panels—just the Hetron that makes them safer. We'll be glad to send you a list of fabricators. Please write Durez® Plastics Division, Hooker Chemical Corporation, 8011 Walck Road, North Tonawanda, N. Y. 14121.

**SIDE-MOUNTED FOUNTAINS**

Most Halsey Taylor free-standing water coolers can be adapted for bi-level use by adding a side-mounted drinking fountain. Ideal for elementary schools where adults and children use the same fountain. Separate valve and automatic stream regulator — available in stainless steel or vitreous china.

**BI-LEVEL FOUNTAINS & COOLERS**

The convenient, practical way to serve refrigerated water to both adults and children. Ideal for supermarkets, department stores, and public buildings frequented by different age groups. Bi-Level installation consists of factory-adapted, wall-mounted cooler with low-level accessory fountain. Insulated cold water line connects through adjacent panels — only single waste line is required to serve dual units.

Stainless steel receptacles; cabinets are available in Bonderized steel with choice of colors, stainless steel, or vinyl-laminated steel in silver, spice, or mocha brown.

For complete information about the Halsey Taylor Bi-Level wall-mount assembly or other Halsey Taylor coolers and fountains, write for NEW CATALOG. Also advertised in SWEET'S ARCHITECTURAL FILE and the YELLOW PAGES.

**Product Reports**

Would you call Orus Eash's church a courageous design? In some areas, it would be controversial. Yet the building has an eloquent majesty, a strength, a serenity, a feeling of welcome, that sets it apart as a center of worship.

Immanuel Baptist Church is a creative, imaginative design... a strong achievement of an architect's goals.

That stock Andersen Casement Windows can become a part of such designs... not inhibiting the architect in any way... is a tribute to their finely detailed lines and the craftsmanship in their manufacture.

This is window beauty... contributing to the overall architectural scheme without becoming obtrusive.

And it comes with the assurance that Andersen Casements will operate smoothly, silently, effortlessly for the life of the building. They will save on heating costs. They will...
provide draft-free comfort... because they're precision built to be at least 4 times more weathertight than ordinary windows.

Check Sweet's File. Or contact your Andersen distributor for a Tracing Detail File. All Andersen Windows are readily available in the United States and Canada.
CHAIN LINK FENCE SYSTEM
Details and suggested applications of Colorbond resin-clad steel fence system are given in a foldout catalog. Specifications and prices of all components of the system are set out in chart form; categories of equipment are coded according to appropriate usage, and an explanation of the charts is given to make it easy for customers to specify exactly what they need for individual requirements. Specify the U/L Rated Vapor Barrier that passes every test...

Chemicals, used to make some vapor barriers flame resistant, leach out when exposed to moisture, allowing the barrier to burn. This cannot happen to Pyro-Kure as shown here:

1) Barriers are exposed to moisture.

2) Barriers are then dried out.

FOUR PLACES TO SPECIFY PYRO-KURE VAPOR BARRIERS FOR PERMANENT PROTECTION AGAINST FIRE

Insulation Jacketing on Low Temperature Lines
A Pyro-Kure grade is available for use on lines carrying temperatures from -50°F to sub-zero.

Insulation Facing for Ducts, Walls and Ceilings
A number of Pyro-Kure grades are available for vapor barrier applications throughout the building.

Insulation Jacketing on Service Lines
Pyro-Kure 601 provides a permanent noncombustible barrier for lines carrying temperatures from -50°F and up.

Zone Barriers and Reflective Liners
Pyro-Kure now provides permanent noncombustibility plus airproofness for ventilated ceilings and for lighting plenums.
Pyro-Kure®
PERMANENTLY NONCOMBUSTIBLE

(3) Flame is applied, treated barrier starts to burn.
(4) Treated barrier engulfed by flames. Pyro-Kure snuffs out flame, won't burn ever!

This dramatic flame-snuffing ability comes from Sisalkraft's exclusive Pyro-Kure adhesive. It is a patented flame-extinguishing formulation that keeps the Vapor Barrier noncombustible no matter what environments it might be subjected to or how long it is in place.

This is not true with other "rated" barriers. Moisture, humidity and aging can cause other types of flame-extinguishing chemical to leach out, or corrode aluminum.

This difference is why Pyro-Kure is called the permanently noncombustible vapor barrier. Why its U/L Flame Spread Rating of "25 or less . . ." is not restricted in any way or will never be reduced. It is also why Pyro-Kure Vapor Barriers comply with the National Building Code standard for Noncombustibility as defined by the American Insurance Association.

Specify Pyro-Kure Vapor Barriers. Give your clients maximum protection against fire hazard, and against condensation. Various grades are available, including aluminum foil to kraft, vinyl film to foil, and kraft to kraft, from leading insulation manufacturers under their own brand names, or through insulation contractors for local application. All grades are reinforced with glass fibers for strength. Complete specifications are in Sweet's Catalogs.

Send for Samples and Technical Data Kit which includes perm ratings and other physical property information. Write: Sisalkraft, 41 Starkey Ave., Attleboro, Massachusetts 02303.

What small but significant Carnes detail contributes to the elegance of the Century Plaza Hotel?
Carnes eliminated the visible screws customarily used to attach outlets to a wall or ceiling. In this luxury hotel, each of the hundreds of Carnes extruded aluminum air distribution outlets is connected to ductwork with specially devised concealed fasteners. An insignificant detail? Not to the architect, whose sole intent was to make the Century Plaza one of the world's outstanding hotels in every detail. And certainly not to Carnes, where developing products of excellence for specific applications has contributed to acknowledged leadership. Another example of Carnes' engineering superiority is shown in the new air distribution system described below.

INTRODUCING THE CARNES MOTORIZED AIR DISTRIBUTION SYSTEM

New, simplified air conditioning system for large space areas eliminates 90% of ductwork, cuts cost up to 50% by using ceiling mounted motorized, fan-propelled air diffusers.

Proven in 123 installations! An economical, flexible method of delivering conditioned air to specific areas in accordance with needs, via ceiling mounted diffusers. Eliminates up to 90% of costly insulated ductwork otherwise used, by utilizing conventional air conditioning equipment and building construction. Saves 50% or more in initial system installation costs by eliminating the need for sealed, pressurized ceiling plenums. Provides the comfort of "space balanced" air in even the largest supers, shopping centers and similar spacious quarters. Includes all the advantages of "traffic flow plan" engineering — with maximum changeover flexibility. It's there — everything — built into Carnes' new Motorized Air Distribution System. Write for Carnes' facts-catalog No. D-48K.

a new dimension in sound control
Natcoustistile

Here, even the liveliest youngsters can't cause a reverberating, ear shattering din. Because Natco Ceramic Glazed Natcoustistile forms the walls surrounding the pool at Campion Jesuit High School, Prairie du Chien, Wisconsin. Natcoustistile — a perforated face unit — cuts noise up to 65%. High sound absorption in this genuine structural clay unit is combined with a permanent ceramic glazed finish. Natcoustistile is load bearing, and fireproof, too. Modern Natcoustistile complements the refreshing aqua shading in the pool with an accent of modest charcoal, blue-green and white. Of course, a variety of other colors are available to match your color scheme.

Natco ceramic glazed Vitratile is used in other areas of the school. Natco has structural clay products to meet every design requirement. Write for catalog S-65.

Natcoustistile is available in two nominal face sizes: 8" x 16", random pattern only, and 5½" x 12", in random or uniform patterns.

One of many applications of Natco products at Campion Jesuit High School.
Biggest thing in built-ins since central air conditioning

MagiVac
BUILT-IN CLEANING SYSTEM

CAPTURES THE IMAGINATION OF EVERY HOUSEWIFE!
The house without central vacuuming will soon become as obsolete as today's home without central heating and air conditioning! That's why you should include MagiVac in your plans now to safeguard the present and future value of your homes! MagiVac adds so little to the total cost of a home... yet means so much in terms of present and future home value!

- Up to 5 times more powerful than leading portables
- Outcleaned the two most commonly used commercial rug cleaning units in tests by the National Institute of Rug Cleaners* • Reaches deep down dirt other cleaners miss... sends allergy-irritating dust out of the house... out of the air you breathe • Operates at peak efficiency start to finish because there's no dust bag to clog and gradually reduce cleaning power • No heavy equipment to lug... no cords to tangle... remotely located power unit for "noiseless" operation • Built and warranted by the John E. Mitchell Company, a AAA-1 manufacturer of the famous Mark IV automobile air conditioner and other fine products.

*Details of tests available on request

JOHN E. MITCHELL COMPANY/MAGIVAC DIVISION
3800 Commerce • Dept. D • Dallas, Texas

Gentlemen: Please rush free literature on the MagiVac central cleaning system.

Signed:

The beauty of marble...the durability of concrete

In the new Shelby High School, the architect chose terrazzo, not only for high-traffic areas, but for attractive, low-upkeep floors throughout the entire building. The school was built at a cost of $9.25 per square foot for the building—and this included terrazzo in the classrooms.

Few flooring materials have the history of terrazzo. Few can match its beauty. Terrazzo floors laid centuries ago still serve as dramatic tests of time and use. Terrazzo's long life and low maintenance make it a highly desirable flooring material for today's structures.

More and more, architects are choosing terrazzo for its esthetic advantages and remarkable practicality in structures of every size and type.

Portland Cement Association
33 West Grand Avenue, Chicago, Illinois 60610

For an airport terminal...

you can depend on YORK AIR

Buildings with widely varying air conditioning requirements—an airport terminal, for example—require well planned systems to temper and circulate the air. Leading architects and engineers have found they can depend on York for advanced equipment to meet the most exacting specifications.

York leadership in total environment control is demonstrated in buildings of every type, in every climate. Recent York advances in sound control, in odor control, have been recognized as major steps in improved air conditioning. And these advances are helping architects and engineers create better climates for working and living.

When you specify air conditioning for any kind of building, depend on York. Your nearby York Sales Office will provide specification data on any equipment you require. Or write York Corporation, subsidiary of Borg-Warner Cor-

“Structures For Sound” Exhibited In New York

“Structures for Sound,” an exhibit at the Museum of Modern Art in New York which continues until December 5, is a fascinating conglomeration of unconventional musical instruments developed during the past 12 years by French sculptor François Baschet, who also studied acoustics, and by his brother Bernard, a professional sound engineer. Included are 12 examples made of glass rods and various metals such as iron, steel and aluminum; and white plastic balloons, cardboard cones and metal sounding foils which are used as amplifiers. The instruments are played by the use of moistened fingers, rubber mallets or bows, or are plucked like a harp or played like a piano. Earphones have been installed in the galleries so that the public can listen to a recording of music composed for the diverse sounds of the instruments.

Patient Privacy at the Two-Bed Rate . . . Now Possible with FolDoor Partitions

Community Hospital, Indianapolis, Indiana, chose an efficient twin tower radial floor plan for their new 240 bed addition. They also selected FolDoor folding partitions to provide patient privacy in what actually are two-bed rooms.

Utilizing a common entrance and bathroom, each wedge-shaped double room gains adaptability and space efficiency. Space-saving folding partitions extend to create privacy for each patient . . . or the FolDoors can be rolled back instantly to permit patient communication, maintenance activities, etc.

Contact your FolDoor Distributor or Holcomb & Hoke for further information.

Another FolDoor Total Excellence product from...
AT LAST: A TANK THAT REALLY STAYS DRY

The so-called "insulated" closet tank isn't new—but an insulated tank that really ends tank-wiping and floor-mopping is new. New from Crane... the Neu-Sahara, the tank that stays sweat-free even when bathroom temperatures soar to a shower-steamy 80° with 70% humidity. Even when the tank water is near freezing.

Under similar conditions, a major competitive "insulated" tank starts sweating when the water is around 60°. (See chart at right).

To prove the insulation superiority of Neu-Sahara's molded-in liner, we put one filled with ice cubes in a 100° room. After 24 hours, the cubes were still cubes. No sweat on the tank!

Neu-Sahara doesn't need a bulky oversize tank, either. The urethane liner will not separate, and won't absorb water. It soaks up sound instead, to make operation whisper-quiet.

Neu-Sahara tanks will make eight styles of Crane closets sell faster. Write for details: Crane Co., Dept. 008, 4100 S. Kedzie Ave., Chicago 60632.

In climates as varied as Southern California and Northern Ohio, in every style of architecture, Trane offers one-source responsibility for your total school needs—cooling, heating and ventilating.

Today’s total air conditioning needs for schools require specialists in many fields. With Trane you get all the answers from a single source.

35 years’ experience in school field
Trane knows the school market and what is needed to provide the ideal climate for learning. It has 35 years’ experience in the school market and is also a major manufacturer of air conditioning and refrigeration products. That’s why Trane has long been recognized as the company to call upon to air condition schools of all types.

There is only one best way to air condition a school . . . now or later . . . and you get objective advice from TRANE
Because TRANE offers broad lines of many types of equipment—to meet any requirement in any school plan—it can provide impartial assistance to school boards, architects and consulting engineers in selecting the best system for a school. Means you’re free to pick and choose and base your specifications entirely on what’s best for your plans.

Single source responsibility
With all the air conditioning, heating and ventilating equipment for your school from TRANE, you can look to one manufacturer for equipment performance and service needs. There’s no “buck passing.” TRANE assumes responsibility. That’s single source responsibility!
Mayfield Senior High School, in suburban Cleveland. Features total air conditioning—heating, ventilating and cooling equipment by TRANE. Unique architectural design (see exterior, below) made possible totally air-conditioned school at a cost of $11.50 per sq. ft.—15% below area's average non-air-conditioned school construction costs. Ward and Schneider, Architects, Cleveland. Byers, Urban, Klug & Pittenger, Consulting Engineers, Cleveland.

Local offices sell and service only TRANE equipment

With TRANE there’s the added assurance of on-the-spot attention. There are 120 TRANE sales offices located strategically throughout the United States. They’re staffed by graduate sales engineers and factory-trained service engineers who sell and service only TRANE equipment. Their only concern is your satisfaction.

Talk to TRANE

For greater school design flexibility, plus the air conditioning that’s best with your plans, contact your local TRANE sales office. Your TRANE Sales Engineer will be happy to give you specific information on the complete TRANE lines of school heating, cooling and ventilating equipment. Just contact him.

Miami-Dade Junior College Plans New South Campus

In foreground from left to right are the science & classroom building, learning resources center, and administration building; in background are the technology and classroom building, gymnasium, and fine arts building.

Construction is expected to start in September on the $7.8 million first phase of the south campus of Miami-Dade Junior College in Florida. Architects and engineers for the project are the firm of Pancoast, Ferdinando, Grafton & Skeels.

Included in the first phase of the three-phase master campus plan are three major buildings—a science and classroom building; an administration building; and a learning resources center. Phase one also includes a service building, two architectural "lakes," athletic fields and an entry plaza, plus landscaping of surrounding grounds and parking areas.

The science and classroom building is a three-story structure containing 125,000 square feet. The bottom two floors will contain laboratories and offices with the third story devoted to classrooms.

The administration building will house headquarters for both the existing north campus of the college and the new south campus. The one-story structure will contain 24,000 square feet.

The east half of the two-story learning resources center will contain library areas surrounded by classrooms which can yield to future library expansion. The other half of the structure, which contains 128,000 square feet, will contain four concentric teaching auditoria beneath a second story of audio-visual areas.

A major purpose of the MIA is to assist architects and other members of the building team in solving problems and answering questions of many types, especially those concerning marble. One ever-ready way could be through the product literature we produce for your use.

This ranges from our technically-oriented literature such as "Marble Engineering Handbook" to our promotional publications, most of which are useful in helping you sell the idea of marble to all types of clients. These brochures and booklets — fully illustrated — answer recurring questions raised by Bankers, Educators, Commercial Builders, Hospital Boards and Homeowners. They contain good reasons why the best building materials, such as marble, are always the wisest choice in the long run. Write, stating your needs, and we will send you the appropriate publications — without charge, of course.

MIA members everywhere will welcome your inquiries and will be glad to give you as much technical assistance as possible in your project planning. So please let us know how we can be of help to you in selling your clients good vs. adequate or downright poor materials which cheapen and downgrade good design. In serving the cause of better architecture in this country — we're with you.

Do wonders...

or do functional, hard-working designs. Both look better longer with highly corrosion resistant Reynolds Aluminum Roofing and Siding.

One of the most important materials you have to specify is roofing and siding—usually the most noticed parts of buildings. With Reynolds Aluminum roofing and siding you can be certain of better performance than with most other materials. There are no chips or cracks to mar your design whether you specify a mill finish or a Colorweld® baked enamel finish. Aluminum is highly corrosion resistant, too. Streaks and stains won't ruin a building's appearance. Design flexibility is greater, too. There is a large selection of configurations, thicknesses and finishes.* Panels adapt from single skin to insulated wall systems quickly, easily. Aluminum's reflectivity is higher... heating and cooling costs lower. Lighter in weight... less time and effort to erect. See your Sweet's File, Section 8b/Rey or AIA File Number 12-C for more information. Or write: Reynolds Metals Company Building Products and Supply Division, Dept. AR-1165, 325 West Touhy Avenue, Park Ridge, Illinois 60068.

Watch "The Red Skelton Hour," Tuesdays, CBS-TV.
From X-Rays to Flowers to Architecture to Computers: A Logical Progression

Lowell Nesbitt, 32-year-old New York artist whose one-man show closed last month at the Howard Wise Gallery in New York City, has logically evolved in subject matter from X-rays of the human body to massive, almost stylized representations of flowers; to blow-ups of the static repetition of details in early 20th century architecture, to enlargements of exterior and interior details of IBM machines. The artist’s reasons for this subjective progression are architectonic.

According to Mr. Nesbitt, he first started in 1963 with X-rays of the human body because “it shows the body at its most architectonic and geometric state. The X-rays had soft echoes within them that logically led to the portrayal of flower petals.” He then jumped to the more temporal representation of details from early 20th century architecture, having been inspired by the architecture of South Broadway in Manhattan. “There is the same repetition of forms in human ribs, flower petals, columns and windows or steps of a staircase,” said the artist, “and this repetition carries over into the magnetic tape of computers.” The computer detail paintings represent to the artist the present and the future.

Mr. Nesbitt was inspired by the machines in IBM showroom windows which the artist thought “were very dull looking but would be exciting as paintings.”

The next step in this logical progression is not known, but could there possibly be another logical step?

Orchid—‘65; medium: oil; 50” x 50”

Black Windows; medium: oil; 60” x 77”

IBM; medium: oil; 80” x 80”

ARCHITECTURAL RECORD November 1965 319

Darlington House, a Jewish home for the aged, in Toledo, Ohio, is entirely glazed with Thermo-pane® insulating glass for the year-round comfort of patients. Architects and Engineers: Samborn, Steketee, Otis & Evans, Toledo. Glazing Contractor: Ohio Plate Glass Co., Toledo.
Capistrano-By-The-Sea, a geriatrics hospital at Dana Point, California, sits on a peak overlooking the Pacific Ocean on one side and facing woods and rolling hills on the other. The building is glazed with Parallel-O-Plate® glass and has sliding glass doors opening onto small patios. All glass areas are protected from the sun with wide roof overhangs. Architects: Ramberg & Lowrey, Santa Ana. Glazing Contractor: Arrow Glass Co., Santa Ana, Calif.

Three ways to provide visual freedom for the aged

These three buildings, designed for the care or housing of the aged, are in widely separated geographical locations. They all avoid the dreary institutional look of small windows. Instead, large window walls open interiors to beautiful landscapes around them. Comforting to the occupants. Each building is glazed with a different L-O-F flat glass product. L-O-F makes a particular kind of glass for every purpose in Open World design. For information, refer to Sweet's Architectural File or call your L-O-F glass distributor or dealer, listed under "Glass" in the Yellow Pages. Or write to Libbey-Owens-Ford Glass Company, Toledo, Ohio 43624.

Elegant Texas Bank
Designed by Welton Becket

The recently completed First State Bank of Clear Lake City, Texas, designed by Welton Becket and Associates, architects and engineers, has a massive, clear span structural steel roof gaining support from two columns on each of its four sides, providing a 9,000-square-foot clear span over the 6,000-square-foot bank. The $450,000 fully glass-enclosed bank utilizes a two-way built up joist-type truss to achieve the span.

Exposed aggregate covering the exterior floor of the 11,000-square-foot podium on which the bank rests matches the exposed aggregate of the sculptured roof-support columns. The glass enclosing the bank is tinted grey for sun control and is set in simple bronze anodized rectangular frames. The bronze frames harmonize with the white tones of the roof facia.

The bank has a four-foot two-inch module which is carried through the entire project. Interior colors were selected by the architects for elegance and refinement and range through beige, brown and black tones with other accent colors. Three drive-up teller windows are provided as well as parking for 45 cars. Clear Lake City is a joint venture of the Del E. Webb Corporation and Humble Oil and Refining Company.

KICKOFF TIME

KICKOFF TIME was when she turned the knob. This Lockwood dormitory lock has an exciting safety feature. The husky solid brass deadbolt which gives so much security is locked by the turnknob but "kicked off" by simply turning the inside knob.

Of course it's just a convenience now, but think of what it means in case of fire or other emergency. No groping in the dark for turnknob or key by a panic stricken co-ed. A twist of the knob means safety.

Long, trouble free life with this mortise lock too. Could well last right up to the class of '75—2075 that is.

You can make any building look better
with PPG Feneshield® fabrics

Does that scene on the left look familiar? It should. It's typical of a building where window treatment has gotten out of hand. Result: an unfortunate mixture of shading devices, loss of clean architectural lines, compromise of building design, a generally unattractive impression.

The exterior appearance of any building... new or old... can be improved immensely through the specification of Feneshield fabrics, made of PPG Feneshield® fiber glass yarns, such as those shown above.

Feneshield fabrics can be obtained in a wide variety of weaves, colors, and patterns to complement any building design. These fabrics present a pleasing appearance at every window, permit a bold flow of line from street level to top floor, eliminate random vertical settings, and enhance the total architectural concept of any building.

But that's just one of Feneshield fabrics' advantages. These same fabrics can also control interior environment. Through PPG research, all Feneshield fabrics are performance-rated according to fabric characteristics. Through this Feneshield system, drapery fabrics can be chosen to subdue radiant heat, control glare, improve sound control, enhance a good view or modify a bad one.

What about costs? Over a five year period, total initial and maintenance costs for Feneshield fabrics are less than those for mechanical shading devices. Get more facts. Participating drapery converters have authorized Feneshield presentations showing the wide range of beautiful fabrics now available.

Through the use of PPG technical data, they can help you select fabrics for specific installations. Write directly to PPG for names of converter representatives near you and for technical information. Use the coupon.

PPG makes the Feneshield fiber glass yarns only, not the fabric.

fiber glass
...the fiber glass for finer fabrics
HOW TO SOLVE FIVE CONCRETE FLOOR PROBLEMS WITH ONE PRODUCT

By Don Guntin, Sonneborn Building Products, Inc.

Clients know that maintaining concrete floors can turn into an expensive problem—if you don't specify the right product. Incorrectly treated floors wear and crumble under chemical attack, produce dust from abrasion, look unsightly. Such conditions, unless checked, often lead to floor patching, resurfacing, even replacing!

Only Sonothane Solves All Five

A quick glance at the chart shows a number of products...and a number of problems. Also that most concrete treatments solve only two of the five problems—though the epoxies almost solve them all.

None but Sonothane, however, solves all five! The only one-component polyurethane sealer-hardener designed specifically for concrete, Sonothane toughens and hardens floors so they give up to six times the wear of conventional finishes—better chemical protection than any other product.

Classroom Building Has Central Commons

The classroom building for the college and the theological school at The Academy of the New Church, Bryn Athyn, Pennsylvania is a two-story structure designed for a capacity of 200. A notable feature of the design is a two-story, top-lighted central commons which serves as a lobby for the lecture room/chapel, also extending for both levels. On the first level around the commons are two 50-seat lecture rooms, one for 25, an education laboratory, four seminar rooms, and offices.

On the upper level are the student and faculty lounges, and the Theological School. The building will be faced with smooth concrete and will have pitched roofs covered with hand-split cedar shakes to contrast with the concrete. Architects were Martin, Stuart, Noble & Class (now Stewart, Noble, Class & Partners).

Sunshine Biscuit treated over 500,000 square feet of concrete floor with Sonothane—after "other products" had failed to withstand daily traffic and resistance to chemical cleaners. Your Sonneborn Representative can give you full particulars as to why Sonothane treated floors are stronger, wear better, look so much better. See him. Sweet's Catalog, or clip the coupon.

SCHOOL PLANS shown here are from a new AAF/Herman Nelson brochure showing how unit ventilators fit into the most advanced school designs by some of America's leading architects. Write for your copy.
If Herman Nelson classroom unit ventilators cost a little more
...why do so many budget-wise architects select them as the base bid?

Simply put: they're designing a far greater value into their schools.
A 5% saving on unit ventilators for an average school represents a savings of about .32% of the total school cost. And that .32% can begin to look smaller and smaller in a few years should the lower-cost units need replacement, as they did recently in one Long Island school.

We don't say that Herman Nelson heating, air conditioning, ventilating unit ventilators are ten times better built than others. Not even twice so perhaps. But they are worth any slight difference you might have to pay. Here are some reasons why:

ONE-PIECE UNITIZED FRAME (something you'll probably never even see) helps make sure Herman Nelson unit ventilators last as long as your building.

DRAFT/STOP DESIGN captures chilling down-drafts from the windows without adding additional (and unneeded) heat to the room.

5-YEAR WARRANTY (Type G units)—Covers both parts and labor should our units not perform as we promised. It backs up your decision to specify Herman Nelson with action, not talk.

If we build them a little better than the others, it's for a good reason. We want them to last the life of the school building. We think you do too. Write for the new booklet "Architects Are Ingenious People—and the Ways They're Using Unit Ventilators Today Prove It." American Air Filter Company, Inc., 215 Central Avenue, Louisville, Ky., 40208. In Canada: American Air Filter of Canada, Ltd., Montreal 9, Quebec.

FAR-SIGHTED PLANNERS CHOOSE HERMAN NELSON.

You Can Afford These DeVAC Windows with Your Savings on HVAC Plant Alone!

DeVAC Thermo-Barrier Windows reduce heat transfer so greatly that you can safely specify lower capacity heating and air conditioning. The savings should more than cover the costs of the patented DeVAC dual glazed windows.

Client Bonuses are year-after-year savings in HVAC plant operating costs plus the virtual elimination of future maintenance.

Take heating in Northern zones: DeVAC Thermo-Barrier construction is 82% more efficient than standard, twin-pane-type dual glazing in reducing heat losses.

Take cooling in Southern zones: DeVAC Thermo-Barrier Windows are 130% more efficient than standard single glazing in reducing heat gains.

Look for DeVAC Windows in Sweets and clip the coupon for more information.

One phone call from Dodge Reports put this busy designer in contact with 5 key GC's, 17 subs, 10 material and equipment suppliers, and 2 potential future clients.

When this busy designer spoke to his Dodge Construction News Reporter about his plans for a new office building, he received a number of direct and indirect benefits:

1. During the planning stage, prospective suppliers of materials and equipment were alerted. This brought him valuable new information that reached him at the time he was working on plans.
2. As a result, he avoided needless solicitations and speeded up planning because contacts were geared to his specific job.
3. As he neared the bidding stage, he took advantage of Dodge's Bid Date Counseling Service to avoid possible conflicts in bid dates. He was able to schedule the best time for contractors and suppliers to zero in on his job.
4. Placing plans on file at the closest Dodge Plan Room brought him the widest possible range of bids from qualified subs and suppliers. At the same time, traffic in his office was reduced and plan reproduction costs were kept to a minimum.
5. At every stage of job development, he was saved countless hours because contractors and suppliers kept abreast of his job by calling Dodge Reports—not him.
6. His Dodge Reporter wound up the call by mentioning two jobs in the area for which designers had not yet been selected.

Designers in 38 states will tell you that users of Dodge Reports are progressive, financially stable, and eminently qualified to serve your needs.

If you practice in Southern California, Arizona or Nevada, watch for the announcement of Dodge Reports Plan Rooms and Construction News Services coming your way soon.

Look this dimension for yourself... You see here an actual size profile view of our Silent Gliss S1030 flange-mounted, solid extruded aluminum cord traversing track. It measures exactly 1/4". No more.

Compare this dimension with our competition and consider. If you really want the trimmest, slimmest, best looking ceiling-mounted track—that's also the smoothest, most silent running, and in all respects best for the job—is there really any choice?

STATEMENT OF OWNERSHIP, MANAGEMENT AND CIRCULATION (ACT OF OCTOBER 23, 1962; SECTION 4369, TITLE 39, UNITED STATES CODE)

2. Title of Publication.—ARCHITECTURAL RECORD (combined with American Architect and Architecture).

3. Frequency of Issue.—Monthly, except May, when semi-monthly.

4. Location of Known Office of Publication (Street, city, county, state, zip code).—330 West 42nd Street, City, County and State of New York—10036.

5. Location of Headquarters or General Business Offices of the Publishers (not printers)—330 West 42nd Street, City, County and State of New York—10036.

6. Names and Addresses of Publisher, Editor and Managing Editor.—Publisher; Eugene E. Weyeneth, 330 West 42nd Street, New York, N.Y.—10036; Editor: Emerson Goble, 330 West 42nd Street, New York, N.Y.—10036; Managing Editor: Miss Jeanne Davern, 330 West 42nd Street, New York, N.Y.—10036.

8. Known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages or other securities (if there are none, so state).—None.

9. Paragraphs 7 and 8 include, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, also the statements in the two paragraphs show the affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in capacity other than that of a bona fide owner. Names and addresses of individuals who are stockholders of a corporation which itself is a stockholder or holder of bonds, mortgages or other securities of the publishing corporation have been included in paragraphs 7 and 8 when the interests of such individuals are equivalent to 1 per cent or more of the total amount of the stock or securities of the publishing corporation.

10. This item must be completed for all publications except those which do not carry advertising other than the publisher's own and which are named in Section 182.231, 182.232, and 182.233, Postal Manual (Sections 4355a, 4355b, and 4356 of Title 39, United States Code):

A. Total no. copies printed (net press run)—average no. copies each issue during the last 12 months, 47,721; single issue nearest to filing date, 47,363.

B. Paid Circulation. 1. To term subscribers by mail, carrier delivery or by other means—average no. copies each issue during preceding 12 months, 40,750; single issue nearest to filing date, 41,800. 2. Sales through agents, news dealers or otherwise—average no. copies each issue during preceding 12 months—single issue nearest to filing date—.

C. Free distribution (including samples) by mail, carrier delivery, or by other means—average no. copies each issue during preceding 12 months, 4,575; single issue nearest to filing date, 4,575.

D. Total no. of copies distributed (Sum of lines B1, B2 and C)—average no. of copies each issue during preceding 12 months, 46,256; single issue nearest to filing date, 46,171.

I certify that the statements made by me above are correct and complete.

ATTRACTIVE?
SURE, AND THERE’S
A SEASONMAKER
HORIZONTAL FAN-COIL
AIR CONDITIONER
TO MEET
EVERY APPLICATION

LOOK TO THE LEADER... McQuay

Fact is—McQuay has the most complete line of horizontal Fan-Coil units in the industry. Exposed or concealed, direct drive or belt drive, using chilled water or direct expansion refrigerant... there’s a McQuay Large Capacity SEASONMAKER available to meet your needs. Direct Drive units are available in five sizes from 600 cfm to 2000 cfm with 1.5 thru 5 tons nominal cooling capacity. Belt Drive units in five sizes from 800 cfm to 3000 cfm with 2 thru 10 tons nominal cooling capacity. Heating coils are available as an option. Seasonmaker Large Capacity Hideaway models are designed for installation above a furred ceiling or other concealed location. Ceiling units are designed for suspended installation in the conditioned space. Of course, all units have the construction and performance features which have made McQuay SEASONMAKER Air Conditioners famous.
For complete engineering data, technical information and prices, contact your local McQuay Representative or write McQuay—Large Capacity SEASONMAKER Catalog #722-2 and #730-2.

Solve your delivery problems! Whether you need one or 100 units, McQuay carries many sizes and types of direct drive units in stock ready for immediate shipment.
Enjoy the ELEGANCE of GENUINE QUARRY TILE FLOORING

For the finest flooring, Ludowici is preferred not only for unsurpassed elegance but also for its easy care and everlasting quality.

Famous Patterns of Special Shapes

Brushed or smooth red or fire-flashed colors that never fade or discolor.

“Housing Facts and Trends” meets the long-felt need for quick and easy access to basic housing market data heretofore available only from a multiplicity of private and governmental sources.

This time-saving reference book includes:

- 200 pages of housing industry statistics
- plus interpretive comment
- Hundreds of detailed tables and illustrative charts specially prepared for this volume
- Eight major reference sections:
  - Background Data
  - Trends, Structural
  - Trends, Geographic
  - Trends, Economic
  - Trends, Labor and Materials
  - Building Types
  - Characteristics of Buyers, Sellers, Builders
  - Projections

Prepared by House & Home with the assistance of its McGraw-Hill associate, the F. W. Dodge Company, “Housing Facts and Trends” puts at your fingertips the hard-to-dig-out housing market information you need.

Sealing problems solved by can ...or by man

You've simply got a lot going for you with Weatherban® Brand One-Part Sealant 101. The product itself solves most sealing problems. Offers the proven dependability of a polysulfide (Thiokol® based) sealant in ready-mixed, easy-to-use form. And the "Weatherban® Man will help you solve the rest. He's ready to assist you right from joint design stages on. If you like, he'll even be at the job site to help the calking crew get started, recommend application equipment—you name it. Just request him, he'll be there.

But odds are, you just won't need help at the job. "Weatherban® Sealant 101 comes ready for use—no mixing, no mess. Applies smoothly, easily—no sag or flow in seams. Fact is, it's just plain hard to make a mistake with this one. It can be applied to damp surfaces (unlike most others), bonds tightly to all materials, cures to a tough, flexible, permanent seal. Once tooled, it stays tooled. Becomes tack-free in two hours—or immediately if sprayed with water. Won't stain or corrode surfaces, doesn't collect dirt. Absolutely will not shrink after application. And the cured sealer withstands temps from -40 to +160°F.

It pays to rely on your "Weatherban® Man.

UNIVERS is a Feather Touch* panic exit device. It combines beauty, maximum security with a quick, faultless exit function. The Uni-Vers features a basic rim element that may be easily modified to vertical by adding top and bottom latch units. Here's true universability. Available in all metals and finishes, it is virtually tamper-proof and "kid" proof. Built for long service life. But most important, S&G's Feather Touch release permits even a child to exit safely under hysterical, panic conditions.

"VIM" goes High...Wide...and LAMSON with Selective Vertical Conveyors

The Post Office has developed a farsighted Vertical Improved Mail (VIM) System for fast, continuous service in high-rise buildings. At the heart of this system is the selective vertical conveyor.

LAMSON, pioneer in mechanized communications systems, has designed, built and installed a large majority of the world's vertical conveyors, including the highest and largest systems.

In addition to the selective vertical conveyor, a VIM System also includes a truck dock and a Post Office operated mail room at street or basement level. Here, incoming mail is sorted and locked in tenants' trays for automatic dispatch to all floors via the conveyor. Tenants pick up trays at floor service stations. Outgoing mail may also be sent down to the Post Office mail room from these points.

VIM offers many advantages: mail is delivered early to all floors... security is improved... congestion from bags and carts in building is relieved... day-long mailing permits faster processing to and through the main Post Office... contract messenger service is reduced. Equally important: major tenants occupying several floors can use conveyors for their own interoffice distribution of mail, supplies, EDP tapes and cards, etc.

Continuous, high-speed mail service is the lifeline of any business. In designing new high-rise buildings, consider carefully the additional income, efficiency and utility value provided by making provision for a VIM System. For full details on selective vertical conveyors, write to: LAMSON CORPORATION, 183 Lamson Street, Syracuse, New York 13201.

MARACON
SAVES TIME / CUTS COST
OF PRESTRESSED BEAMS FOR
Multi-Million Dollar
DEPARTMENT OF HIGHWAYS,
ONTARIO, PROJECT

"BETTER BOND OF CONCRETE TO STEEL ... NO COLD JOINTS ... BETTER CONTROL OF MIX ... DESTRESS 5 TO 6 HOURS SOONER ..."

Beams were destressed in 10-11 hours with strengths of 4000 p.s.i. — a saving of 5-6 hours — resulting in faster production and lower costs. The strength required to destress is 3900-4000 p.s.i. With MARACON the 10-hour strength was 4500 p.s.i.; at 13 hours, 5300 p.s.i. and at 16 hours, 6300 p.s.i. "The 28-day strength exceeded 8500 p.s.i."

Beams are 87 1/2 ft. long and each weighs approximately 44 tons. Specifications provided for a 7 1/2 bag cement factor, a non-chloride water reducing admixture, 5000 p.s.i. at 28 days and air at 3 1/2 - 4 1/2%. Technical design and service were supplied by Concrete Control Chemical Company, Ltd., Kitchener (Ontario distributor of MARACON). MARACON-A water reducing admixture was used.

"MARACON is the registered trade name for a series of concrete admixtures manufactured by Chemical Products Department American Can Company.

ARCHITECTURAL RECORD November 1965 341
9 tons of G-E Silicone Construction Sealant seal new UN Plaza

G-E Silicone Construction Sealant is an amazing synthetic rubber that cures in air. It's waterproof. It won't crumble, harden or peel. So it's the first really permanent sealing compound.

At the new United Nations Plaza apartment and office building, just across from the famous United Nations Building in New York City, nine tons of Silicone Construction Sealant were used for various sealing applications. Seven tons of Silicone Construction Sealant were used to glaze the windows. Another two tons seal the aluminum curtain walls. G-E Silicone Sealant is also used to caulk air ducts as well as miscellaneous caulking throughout the thirty-eight story twin-tower skyscraper.

G-E Silicone Construction Sealant applies quickly and smoothly from a standard caulking gun, forming a tight bond to glass, metal, masonry and other common building materials. No mixing either. And it can be applied easily in any weather...never stiffens in cold or runs because of heat. Cleanup is a cinch. So you save time while you get a good looking, permanent seal that minimizes callbacks.

Available in a wide range of colors, as well as a translucent form, G-E Silicone Construction Sealant blends in well with almost any material. It's stocked by local distributors and in many building supply stores. For complete information, including a new bulletin on guide specifications for Silicone Construction Sealant, check the distributor nearest you, or write to Section BG11100R, Silicone Products Dept., General Electric Company, Waterford, New York.
