ARCHITECTURAL RECORD
MARCH 1977
The Brigantine sheet vinyl floor from Armstrong.

In the school of hard knocks, it's the easy way to keep up appearances.

The school is West Hardin Elementary in Crump, Tennessee. Where the student body, from kindergarten through sixth grade, numbers 270. And where the clean, functional design of the architecture is enhanced by the beauty of Brigantine Vinyl on® on the floor.

School authorities selected Brigantine sheet flooring for three sensible reasons: its lively, attractive appearance; its maintenance; and its will to survive in an aisle of active, busy children.

While Brigantine can be found in many of the classrooms, nowhere are its characteristics shown to better advantage than in the school's all-purpose "commons." Here, the students play basketball (flour lines are painted on) and other games, eat their lunches, assemble for meetings, watch theatrical performances. All that activity takes place on Brigantine's beautiful face.

Brigantine's beauty lies in its dirt-resistant pattern and its wide array of design-coloring colors—three of which can be seen here. Its durability is provided by its tough vinyl composition that stands up to the constant running, jumping and sliding of youthful feet. A composition, by the way, that prevents spills from soaking in, so that the custodial staff clean up in short order.

The fact is, wherever long-lasting, cleaning good looks are called for, you'll find Brigantine at the head of the class. Practical floor covering that comes in rolls up to 90 feet long that eliminate a lot of seams. A handsome floor covering that can attend the school of hard knocks and graduate with honors. To learn more, send for a free copy of our "First Impression" booklet which describes Brigantine or other Armstrong commercial floors.

Armstrong, 303 Rock Street, P.O. Box 409, Lancaster, Pa. 17604.
The Synercon™ 60 Ceiling System from Armstrong.
A new standard of design flexibility produces a new high in energy savings.

The Synercon 60 Ceiling System from Armstrong is all new from the grid to the board, from the lighting options to the air handling. More important than even its newness, however, is its innovation. Innovation that serves to increase design flexibility, decrease energy consumption, and enhance lighting quality.

The new lighting starts with a pendant fixture designed to provide highly efficient task lighting that can save as much as 65% in electrical costs when compared to conventional-type recessed troffers. It accommodates two 40-W lamps which result in 70 or more footcandles at the work surface and is offered with a special double lens that controls brightness and effectively beams the light exactly where it's needed. What's more, with the fixture suspended, the ceiling is 100% acoustical material.

With the Synercon 60 Ceiling System, however, that's only the start. Because there are two other lighting options as well. The newly designed recessed troffer you see above that also saves energy because it normally requires fewer fixtures than competitive systems. And the energy-efficient sodium fixture has b...
Further lighting is this 29"-square fixture with high-pressure sodium lamp, offered with standard or polarized lens or parabolic louver.

Air-handling options include air boot and bar for constant-volume systems as well as two variable-volume systems designed for energy savings.

Especially designed to control brightness without seriously reducing the lamps' efficiency. Optional polarized lenses with these fixtures can further lower energy requirements as well as improve lighting quality by reducing veiling reflections.

With all three systems, the lighting efficiencies result in both immediate and long-term cost reductions. To deliver 70 footcandles, the pendant fixture can require only .9-1.0 watts per square foot; the high-pressure sodium, only 1.4-1.5; the standard troffer, only 1.9-2.0.

The new grid is three inches wide, with a flat range, and features a 1¾” black reveal that extends down the side of the recess and takes partition studs. It has a five-foot on-center hanging capability and can be 90% slotted for air distribution.

The new board is non-directional Georgian which, combined with the flat grid design, produces a subtle, unobtrusive look. A new super acoustically efficient board called Silok™, shown in main illustration, is also available for use in open plan spaces.

The new air handling gives you a choice of a high-capacity five-foot-long air bar designed for constant-volume systems as well as two variable-volume systems—each with two options—that save energy in several ways. They require no reheat, thus saving the cost of reheating cooled air. They need no external power to operate either valves or thermostats. And by reducing air quantities, they allow a reduction in the size of ductwork and fans.

With all its newness, innovation, and energy efficiencies, the Synercon 60 Ceiling System gives you a sum total of flexibility you've never had available before. In fact, this new system offers so much, we think you'll want to read about it in depth. Write us now for all the technical details. Armstrong, 4203 Rock St., Lancaster, Pa. 17604.

Letters to the editor

We were all very excited about the Baltimore-Washington International Airport article that appeared in the October, 1976 issue of RECORD. I would like to sincerely thank you for your interest, the professional manner in which the article was presented and for the exposure for the BWI Terminal Expansion Program.

Dean S. Roxannis
Public Affairs Specialist
Baltimore-Washington International
Maryland Department of Transportation

I wish to protest Edgar Tafel’s November “review” of John Sergeant’s fine book, Frank Lloyd Wright’s Usonian Houses. It seems to me that a serious journal reporting on a serious book ought to require a serious review. Instead we have a limply essay consisting of tired reminiscences, a defense of Taliesin, a gratuitous remark about the author’s nationality, and the suggestion that since he “was not there,” Sergeant is disqualified to discuss Wright’s career in the 1930s.

The job of a reviewer is to report correctly and tell what it is in a book, to evaluate its thesis, its scholarship, its style, and to indicate its interest for a particular audience. Tafel does none of this. What he does do is remind everyone that he was on the job during the halcyon days. What reason, therefore, does Tafel give for Sergeant’s alleged unfamiliarity with Usonian building problems? He was not there. With one swipe, research, analysis, and scholarship are dismissed. If one was not there, one cannot know.

It is a sorry fact that the self-appointed guardians of Wright’s legacy continue to withhold recognition from deserving “outside” scholars and are still reluctant to share him with the rest of the world. Their attitude has detrimental consequences, and Tafel’s “review” is a case in point. Strategically placed readers of this influential journal have probably drawn the conclusion that Sergeant’s book is inconsequential. In fact, it is the most important study of Wright to appear in several years. (Could Tafel be clearing the field for his own forthcoming biography?)

Taliesin, which Tafel is quick to defend, is an equally irresponsible “guardian.” ‘The claim is made that Taliesin’s “private files” are its own, that it is besieged by researchers. Thus Sergeant’s book is a threat object to Taliesin’s closing its doors to scholars. Of course, not everyone is excluded: not those who can afford a $40 an hour research fee for the privilege of seeing what they are allowed to see—a scandalous archival policy. Could not Taliesin donate Wright’s correspondence and copies of his drawings to established repositories like the Library of Congress, the Burrough Averey Architectural libraries, or the State Historical Society of Wisconsin, or could it not admit reputable scholars as other private archives do?

I am appalled that RECORD, which gave Wright space many years ago when he had no forum, should now be in the position of publishing petty comments about those that take him seriously. Wright and sergeant deserve better. Long after Wright’s guardians are gone, Sergeant’s book will remain as testimony to the architect’s genius and to the author’s skills.

Robert C. Twombly
Associate Professor
Department of History
The City College
The City University of New York

Mr. Tafel suggests that I was not aware of performance failures in some Usonians and that this may have been due to my “not being there” when they were built, or perhaps to my being “a Brit.”

In Chapter 1 there is a section entitled ‘Least Successful Aspects of Usonian’s (pages 29-30) which specifically discusses the wiring problems. Difficulties with mitre-cut corners and other areas not mentioned by Tafel, such as heating, are discussed on pages 112 and 118, and elsewhere. Mr. Tafel’s incompletion at the inclusion of Bruce Goff in the final chapter is more serious as it relates to the book’s subtitle: The Case for Organic Architecture. He only comments on the houses and seems unaware of the chief argument of the book contained in its second half. This sets out Wright’s social and political views, and relates them to events in the 1930s and the decentralized context for all his subsequent work. It also enlarges Wright’s definition of organic. All this Mr. Tafel ignores.

So far as conveying an objective view of Wright goes, I think that it is unfortunately an advantage being physically far from Taliesin. To Mr. Tafel’s suggestion that to write history you must be there, it must be said that this may be subjective, as the participant sees events through the lenses of his own preconceptions and prejudices. Someone who was not there, even from another generation, is more distanced from events but can interpret them alongside current concerns and relevancies. Both have their value.

In your January 1977 Letters column, Edwin C. Rubin wrote to you expressing concern over the absence of personal credits on the Trio Industries building published in your November issue. Responsibility for any omission lies entirely with us.

This project was produced by a team of dedicated professionals on our staff too numerous for individual attention. To have singled out any one (or two, or three) would have shorted all others. Furthermore, the team concept is beneficial to our firm and we see no reason to change it at this time.

4 ARCHITECTURAL RECORD March 1977
How our Soundsoak™ Wall Panels subtract a lot of noise while adding a lot of beauty.

We start with sound-absorbing mineral-fiber board that soaks up noise like an acoustical ceiling. Then we cover it with a soft modacrylic fabric that's reinforced with a woven fiberglass scrim.

But we don't stop there. We manufacture our Soundsoak Wall Panels in 30-inch widths and in both nine- and ten-foot heights—so one man can quickly and easily install them on interior walls in band rooms, offices, steno pools—you name it. And we make them available in ten handsome contemporary colors to help you bring quiet to virtually any decor.

Turn those sound-reflecting walls into sound absorbers. With Soundsoak Wall Panels. And add a lot of beauty while you subtract a lot of noise. To learn more, write Armstrong, 4203 Rock St., Lancaster, Pa. 17604.

GET MORE THAN JUST PRODUCT.

Specify Inryco/Milcor®
Steel Framing Systems

You'll get an honest appraisal of the suitability of steel framing for your project.
The versatility of our light structural steel components (steel studs and joists) makes them suitable for almost any wall or floor condition... with savings in time and costs, plus other desirable advantages. We'll review your projects in detail and show you how these benefits can apply. If our products will not suit your proposed application, we'll tell you so.

You'll get unexcelled design assistance when you need it.
Our experienced engineering staff furnishes design consultation and assistance on hundreds of projects each year... reviewing plans, detailing efficient solutions for complicated conditions, calling attention to over-design or under-design of specified systems.

You'll get experienced counsel for your framing contractor.
Through longtime involvement in both construction and manufacturing, Inryco has become the recognized leader in the steel framing field. We've worked closely with steel framing contractors to develop system innovations and improvements in fabrication and erection techniques. We stand ready to assist your contractor in developing proper framing construction techniques to help you achieve the maximum benefits of our systems.

Consider our systems and services for your next project.
Other companies manufacture and sell steel studs and joists. None have the experience, capability or desire to provide the extras you get from Inryco. Please review the information on Inryco/Milcor Steel Framing Systems in Sweet's Architectural File (section 5.3/In) or Light Construction File (section 5.3/Inr). Then give us a chance to discuss their application to your projects by contacting:
Milcor Division, INRYCO, Inc.; Dept. C-4033; P.O. Box 393; Milwaukee, WI 53201.

Typical applications... low rise and high rise... residential, commercial, institutional, industrial
"General Electric's Weathertron® is the No. 1 selling heat pump in new construction."

"That should pop Aunt Sadie's beaded umbrella."

It took a lot of good reasons to make the GE Weathertron® heat pump number one among specifiers and architects. Here are the most important:

First is the Climatuff™ Compressor with its record of dependability in over a million and a half installations.

Spine Fin™ condenser coils eliminate many brazed connections where leaks can occur.

You can choose from 18 different Weathertron models—18,000 to 240,000 BTUH—for residential and commercial applications, plus a complete line of other heating & cooling equipment.

And you can offer the General Electric National Service Contract on the residential heat pump. All this from GE, the company that pioneered the heat pump back in 1935.

If you're contemplating an air conditioning installation, get in touch with a General Electric Central Air Conditioning dealer. He's in the Yellow Pages under "Air Conditioning Equipment and Systems."

The General Electric Weathertron... America's #1 Selling Heat Pump.
The defense never rests on the roof of the Cuyahoga County Justice Center!

To defend the roof and plaza decks of the Cuyahoga County Justice Center in Cleveland against energy losses and the onslaught of the elements was of prime importance to the designers. Over 200,000 square feet of deck had to remain water tight, perform efficiently and have little or no maintenance for years. All-weather Crete Insul-Top and Plaza Systems were used. Two unique materials account for the success of these systems. One is All-weather Crete, a monolithic insulating fill applied hot and dry, and having an excellent K factor. The other is Alasco RAM, a rubberized asphaltic waterproof membrane that retains its elastic "life" indefinitely. On both roofs and plazas in the Justice Center, Alasco RAM was poured to form a seamless waterproof membrane directly on the flat structural deck. Protection board was adhered to the hot Alasco RAM. All-weather Crete was then compacted over the membrane system, and sloped to drains. The result—a seamless insulating barrier with positive water runoff. Thus, for the life of the building, AWC defends the membrane against thermal shock, ultra-violet rays, the elements, puncture and water ponding. Send for AWC brochure.

ARCHITECTURAL ENGINEERING

131 How much solar heating is economical for a house?

The extent depends upon a number of factors: the weather, the availability of sunlight, added initial system costs, and fuel cost escalation. Architect Don Watson and engineer Fred Broberg show that where not much sun is available, perhaps only a domestic hot water solar system will save money. Where there is lots of sun, more money is saved with 70 per cent or more solar heating. But in all cases a major influence in potential savings is how much the cost of conventional fuels is likely to escalate.

NEXT MONTH IN RECORD

Building Types Study 500:
Looking back over forty years of building types

In honor of its 500th Building Types Study, RECORD has invited two brilliant "historizing architects"—Charles Moore and Richard Oliver, to assess the studies from 1937 to the present. Their analysis will focus upon the evolution of the form of the traditional building type as found in schools; on new building types such as the drive-in and the recycled building; the evolution of new patterns of living as expressed in the everyday house and the vacation house; and the question of style as best shown in churches, stores, restaurants and bars.
Finally, GAF® introduces the first truly color coordinated Architectural Floor Tile Line made to go beautifully with itself in 45 colors, 26 of them new for 1976.

Beautiful. 

For further information, call or write GAF Corporation, Floor Products Division, Dept. F39, Box 1121, Radio City Station, N.Y., N.Y., 10018.
In urban mayor offers some sensible strategies
searching for a new urban policy

Our physical problems of our cities are bad—those tragic facts of a decaying housing stock, worn-out parks, obscene schools, vacant lots, empty stores and industrial buildings behind as businesses—just like the middle-income taxpayer—leave the cities in search of ‘a good life’ somewhere else.

We know pretty well how to solve the social problems—in terms of design and structure, in terms of planning ideas and hard facts of brick and mortar. What we don’t know is where to get the key to do the work; and how to change the social/economic/political picture so that the prioritization and disinvestment doesn’t continue.

Some very sensible thinking on these issues was offered to the National Home Improvement Council last month by the 36-year-old mayor of Portland, Oregon, Neil Goldschmidt. From his place on the urban firing line (before his election he was a Legal Aid attorney) he offers advice that seems so sound it is worthily excerpted:

“We are left in our cities with a population that is predominately lower-income, bi-racial, families, and elderly—a social structure that reinforces the community organization provided by families. Without any regulation of population, we are left without a plan to develop the planning of neighborhood needs and voluntarism of all kinds; housing maintained at housing code standards, without support for neighborhood crime prevention programs, with low voter turnout in school elections, and with unequal school enrollments. In return, we get no demand for police, fire protection, adult juvenile courts, public health clinics, legal aid, garbage, code enforcement, dental health, etc. That’s what we do.”

Mayor Goldschmidt pointed out that the CATCH: “It’s the implications of disinvestment are overwhelming, because they are neighborhoods where the citizens are themselves sufficient to require the most in basic services. As a result, we have spent the past ten years chasing the results of subsidized investment and decay which try to replace collapsed infrastructure of self-help, self-directed and community self-control with even more subsidies.”

Mayor Goldschmidt puts the responsibility for this disinvestment in the city at the Federal government: “It is popular to talk about the ‘natural’ economics of this disinvestment from our cities and the flight of families to the suburbs—about the automobile and cheap land. Nothing about it was natural. It was planned and paid for—subsidized—by Federal housing programs [beginning with veterans’ programs after World War II], Federal highway projects, Federal sewer grants, Federal tax incentives [notably the income-tax deduction for mortgage interest], and Federal energy non-policies. And at every step the cities picked up the invisible tab.”

Mayor Goldschmidt suggested a new beginning based on what we know:

1. “Time is money.”
2. “Private land assembly is often difficult and time-consuming.”
3. “City governments know what they don’t want, but not what they do want.”
4. “There is more to housing our people than Federal participation can handle. Local housing efforts have focused too much on the Federal presence, unwilling to admit that there will never be enough Federal money.”
5. “Psychology is important. Local governments must attack their problems successfully, and market the success. A psychology of a positive market attitude will do more than new Federal programs.”
6. “We have to use Federal, state, and local programs to leverage private funds into the market. 100 per cent subsidies will never do the job.”
7. “Housing doesn’t exist in a vacuum. Whether cities exploit new opportunities to attract families back into the cities will depend on their success in targeting resources to improve the environmental features of neighborhoods, schools, parks, public transit facilities, trees, clean air, crime prevention—all the ingredients of neighborhood stabilization.”
8. “We have to save what we have. This will encourage new construction next door or down the block. No one builds new apartments or homes next to abandoned structures.”
9. “The key is targeting: To start with something that will succeed and achieve it. If we can show success, success will spread.”

Mayor Goldschmidt had some sound advice for meaningful action on the local level:

“If the cities want housing—both new housing and housing rehabilitation—we will have to take the initiative; and that may require us to do any or all of the following:

1. “We can condemn old, substandard, and often vacant dwellings and sell them to rehabilitation contractors . . .”
2. “We can cut the time and cost of development and rehabilitation by aiding with land assembly. We can guarantee water and sewer services to these assembled lots, and ensure that all required development compliances are met when we sell.”
3. “We can provide water-rate incentives for sprinkler units where fire codes now make it impossible to build with wood.”
4. “We can offer land write-downs, tax increments, and tax incentives.”
5. “Because time is money, we can and should shorten time for developers and rehabbers by simplifying our permit procedures.”
6. “We can recognize that there is no one right kind of housing. If what we seek is home ownership, the traditional single-family home is not the only way to get it. Condominiums for middle-income citizens should be considered an alternate—and if they meet public objectives, we should be devising incentives, tax and otherwise, to make them profitable.”
7. “We can ‘package’ opportunities by aggressively taking the initiative to match investors, lender, developers and neighborhoods with the opportunities.”
8. “We can write rehabilitation codes to replace or supplement our housing codes. Our codes were written years after most of our existing housing was built, and their successive standards now frustrate our avowed conservation objectives. We can write codes that are both safe and supportive of our public purposes—with reduced costs and frustration.”

Summing up, Mayor Goldschmidt said:

“If we want housing, these are the initiatives we can take to get the job started. While it once looked hopeless, we now have new hope . . . And we have a new sense of localism and a feeling that we have a new opportunity to control the shaping of our cities.”

This kind of do-it-yourself and positive attitude seems not only refreshing—but very practical—at a time when so many problems are pressing upon the Federal government. It is the spirit that initiated all of the successful “hometown” rehabilitations we wrote about in the December Record. And it seems to me to be a cause which not just mayors—but architects everywhere—need to put their commitment and efforts behind. —Walter F. Wagner Jr.
TESTS PROVE:

Of the leading roofing systems, Fiberglas Perma Ply-R withstands thermal shock better than any other.
The results are in. Grueling, independent tests by Bowser-Morner Testing Laboratories—using National Bureau of Standards performance criteria for built-up roofing systems—have proven what we've been saying all along:

When it comes to thermal shock performance, our Fiberglas® Perma Ply-R built-up roofing system is superior to conventional systems.

As defined by the National Bureau of Standards, "The Thermal Shock Factor (TSF) is an indicator of the roof membrane's ability to withstand the normal temperature changes of its environment. Values of the coefficient of expansion, tensile strength, and load-strain modulus can be used to calculate the TSF."

The heart of our system is the unique, inorganic Perma Ply-R felt. It works two ways to give the system its strength.

First, when daily temperature changes cause a roof to expand and contract, Perma Ply-R is the best reinforcement it can have. That's because the Perma Ply-R felt is made of strong, continuous strand glass fibers. So its physical strength characteristics are similar, both longitudinally and transversely.

Second, Perma Ply-R helps create a monolithic roofing system. The strongest kind of system there is. The reason: Perma Ply-R is a porous felt. So it meshes totally with the bitumen.

What does all this mean to anyone who's faced with specifying a built-up roofing system?

Simple.

Properly installed, our Perma Ply-R system minimizes the possibility of splitting, blistering, and internal deterioration of membranes. It has the potential to outlast any other BUR system money can buy.

If you want to see the "Thermal Shock Performance Comparisons," please contact your local Owens-Corning representative or write: M.H. Meeks, Owens-Corning Fiberglas Corp., Fiberglas Tower, Toledo, Ohio 43659.

They've got the test results that prove every word.

Our Perma Cap surfacing sheet combines two materials: Fiberglas—so it's tough, won't warp or rot. And inert, non-combustible white ceramic granules that reflect sunlight and help minimize thermal shock.

Our Fiberglas Perma Ply-R is a porous felt. So it can mesh with the bitumen, creating a monolithic roofing system that minimizes interply blistering and adds to the roof's outstanding thermal shock performance.

Our Fiberglas roof insulation has its own Fiberglas reinforced asphalt cover. So the bitumen can be applied directly to it, making the insulation an integral part of the membrane.
Will your statement endure until they can choose for themselves where to live and work?

The architect is faced with a unique challenge: the buildings he designs are both private as well as public assets that must meet both the economic needs of business and the esthetic demands of the community.

During the past ten years, Fluoron® has made a major contribution to both architectural design and economics. Fluoron® is the leading Kynar 500® fluorocarbon coating formulated full-strength to assure maximum longevity of the metal panel finishes.

There are many practical reasons to specify Fluoron: low-cost maintenance, long-life color stability for matching building additions, superior adhesion to the substrate and long-term resistance to corrosion and to many common atmospheric pollutants.

But beyond the practical benefits, a beautiful work can make an enduring statement to the community: here is a place where men and women can live and work in harmony with their environment.

How Robinson's saved...

Metalarc lamps help cut lighting energy use 41%—and make the merchandise look great.

Department store lighting: if it helps move the merchandise, it's good. If it doesn't, it isn't.

But today, it has to save energy, too.

This is how Sylvania Metalarc lamps helped give the best of both worlds to J. W. Robinson's 158,000-square-foot Westchester, California store.

Robinson's didn't decide on lighting for this store without a lot of planning and testing first.

The tests took place in a 3,600-square-foot lighting lab in the main store. They tested many kinds of lighting for color, energy use, dramatics. And, of course, customer reaction.

The winners? Sylvania 175-
45,000 a year on its light bill.

Matalarc lamps' excellent color rendering, point-source illumination and efficient energy use are an unbeatable combination. All told, the Westminster store requires only 2.98 watts per square foot for lighting. That's 41% less than the average 5.1 watts in the company's older stores.

70% more from every lighting watt... $45,000 less per year to light this modern store.

To say nothing of the capital saving because of fewer fixtures. Sylvania Matalarc lamps made a large portion of these savings possible.

How do you light a department store from scratch?
Start with Matalarc lamps...
For more details on these or any other Sylvania HID lamps, see your Independent Electrical Distributor. Or write Sylvania Lighting Center, Danvers, Massachusetts 01923.

GTE SYLVANIA
Bally where all our energies are aimed at reducing your energy costs.

We guarantee that Bally Coolers/Freezers with special 4-inch urethane insulation will use less electricity, at lower cost, than 80%* of the Walk-Ins manufactured today.

It's one more reason why you should buy Bally.

Bally is the world's leading producer of Walk-In Coolers/Freezers/Refrigerated Buildings. Can be assembled in any size for indoor or outdoor use... easy to enlarge or relocate. Refrigeration systems from 50°F, cooling to minus 30°F, freezing. Subject to fast depreciation and investment tax credit. (Ask your accountant.) Bally Case & Cooler, Inc., Bally, Pa. 19503. Phone: (215) 845-2311.

ADDRESS ALL CORRESPONDENCE Dept. AR-3

* Our estimate of the number of competitive Walk-Ins being manufactured with 2½" thick urethane... or 3" thick urethane... or wood frame panels with urethane butted in place... or fiberglass... or styrofoam... or other conventional materials.
"Triangles"—a multi-faceted Steuben Crystal sculpture

Announcing the 1976 winners of the Owens-Corning Energy Conservation Awards

Winner, Institutional category
Allen and Miller, Architects, Santa Ana, California, for the Fremont Elementary School, Santa Ana, California

Winner, Special category
Stephen B. Jacobs & Associates, New York, N.Y., for the Printing House, a former loft building in New York City

Winner, Governmental category
Kansas Architects and Planners Associated, Lawrence, Kansas, for the Federal Office Building, Topeka, Kansas

Honorable Mention, Institutional category

The 1976 Energy Conservation Awards Jury
This year’s winners were selected by:
John Street, chief architect, John Portman Associates, Atlanta, Ga.
Charles Schaffner, senior vice-president, Syska & Hennessy, Inc., N.Y.C.
Nathaniel Curtis, partner, Curtis & Davis Architects and Planners, New Orleans, La.

For a look at three of the winning designs, turn the page.
Three winning designs, and why they won

These buildings won top honors in the Owens-Corning Energy Conservation Awards Program for 1976. Look them over. They show how new and not-so-new thinking can produce outstanding energy-saving designs. For more information about all the 1976 winners, write to K.T. Meeks, Owens-Corning Fiberglas Corporation, Fiberglas Tower, Toledo, Ohio 43659.

Printing House, New York City. Recycles an obsolete industrial building to create unique urban style housing. A vertical heat pump provides heating and cooling. Solar panels provide energy for domestic hot water. All insulation standards are upgraded. All windows are 9/16-inch insulating glass.
Federal Office Building, Topeka, Kansas. Uses mass plus heavy insulation in walls and roof to create an energy-conserving envelope. Open, skylighted interior atrium allows minimum exterior glazing. Windows comprise only 17% of exterior wall area. Glazing is recessed or shaded to reduce heat gain in summer. Lighting is 2.3 watts/sq. ft. Estimated saving on heating costs: $2,600/year.

Fremont Elementary School, Santa Ana, California. Poured-in-place concrete construction stores heat in the structure, causes a lag in heat transfer to occupied spaces. Subsurface design and earthen berms reduce heat gain and loss through walls. Total cooling load is cut 20%, electrical consumption is cut by 42.5 kw/hr for annual savings of $2,142.
Antron® II nylon. The best known for its lasting...
Antron II.
The leading contract carpet fiber brand.
Cookson Rolling Grilles. The best way to close an opening.

Specified nationwide by architects who demand dependability, superior craftsmanship and outstanding performance. For information on our custom-engineered rolling door grilles and counter doors, consult our catalog in Sweet's (8.7/Co) or send for your own copy. The Cookson Company, 700 Pennsylvania Avenue, San Francisco, CA 9410
Reflectee

an attractive, low cost alternative to surface mounted fluorescent strip fixtures.

Reflectee is a new ceiling system designed specifically for large retail stores. Fluorescent fixtures are recessed above the ceiling plane into highly reflective troffers, throwing the light where it counts the most — down on your merchandise (not glaring into your customer’s eyes!)

More efficient than strip lighting, Reflectee permits you to use fewer fixtures to maintain desired illumination levels. This means fewer fixtures to install, fewer bulbs to replace, and — most important — lower energy bills!

Reflectee ... an economical and attractive alternative ... Reflect On It!

Insulation in

$1,849,996

Projected cost to heat and cool the 46-acre J.C. Penney warehouse for 20 years with only 15/16-inch Fiberglas roof insulation.

Owens-Corning Fiberglas roof insulation—the only glass fiber roof insulation on the market. Dimensionally stable. Retains thermal value. Easier and less expensive to apply than organic/mineral boards. For over 30 years the best base for built-up roof decks.

*T.M. Reg. O.-C.F.
Projected cost to heat and cool the 46-acre J.C. Penney warehouse for 20 years with thicker 2¼-inch Fiberglas roof insulation. (After allowing for the added cost of thicker insulation!)

**Remarkable savings of $972,024!**

With it, architect Paul Slusarev, Plant Manager of the massive new Penney warehouse/office in Topeka, Kansas, is helping to point the way for designers of schools, stores, and other commercial buildings everywhere.

**Saves money two ways**

1. 2¼ inches of Fiberglas roof insulation vs. a conventional thinner leaves money two ways:
   - It saves on energy costs. Estimated savings per year, based on heating and electric cooling in Topeka City, Kansas, with a projected increase in energy costs at 7% per year and future savings discounted at 10% per year: $64,160 or $972,024 every 20 years.
   - (Due to present availability of natural gas, propane and fuel oil are used as additional fuels for heating, and as a result of using these higher-priced fuels, actual savings may vary.)

2. It saves on construction costs. The first cost of this energy-tight warehouse is actually lower than if a less efficient version had been built! Reason: the improved thermal performance of the roof permits use of less costly heating and cooling equipment. The savings are large enough to cover the added cost of the thicker roof insulation twice over.

**Smart for re-roofing, too**

Thicker Fiberglas roof insulation also makes sense when it's time to re-roof existing buildings. It should pay for itself within a few years, then go on saving thousands in fuel bills for years to come.

Find out the recommended amount of Fiberglas roof insulation to use to save your clients money. Call your Owens-Corning representative or write C.Y. Meeks, Owens-Corning Fiberglas Corp., Fiberglas Tower, Toledo, Ohio 43659.

Owens-Corning is Fiberglas

Beautiful... because the Olympic Stainer System actually forces the stain into the wood, where it dries to a uniform finish that looks as naturally beautiful as the wood itself.

Economical... because virtually all job site problems are eliminated: No weather delays, no painting scaffolds to erect, no bare wood exposed by shrinkage. Choose any Olympic Stain semi-transparent or solid color. For the name of the Olympic Machine Stainer nearest you, or for more information, call your local Olympic Central Warehouse or write: Olympic, Dept. MS, 1148 N.W. Leary Way, Seattle, WA 98107 (206) 789-1000.
New from Robertson: Forma2Wall modules up to 60” wide.

Forma2Wall is now available in infinitely variable modules up to 60 inches wide in painted or anodized aluminum and up to 48 inches wide in painted or stainless steel. It spans up to 16 feet without subframing. Aerospace technology makes possible its honeycomb core, stressed skin design and the absolute quality control of its consistently flat, totally smooth appearance. There is no oil canning or rippling in Forma2Wall. Design freedom and final appearance is enhanced by recessed joinery free of surface seals. ICBO approval permits use in non-combustible construction.

Get the whole story, write: H. H. Robertson Company 9537 Telestar Avenue Suite 127 P.O. Box 5650 El Monte, CA 91734

NuTone Announces
The Most Advanced
Apartment Lobby
Communications
and Entry
Security System
Ever Engineered.

Apartment SecuriCom®
NuTone's Apartment SecuriCom is the
most practical, economical system available for low, medium and high rise
structures. SecuriCom offers designers
and builders tremendous flexibility at an
exceptionally low cost. No rough-ins or
wiring are required in individual apart-
ments, because NuTone's SecuriCom
uses existing telephone lines to carry its
signals! That makes SecuriCom perfect
for existing buildings!
Why NuTone SecuriCom®?
You probably already know the answer... crime is rising and unprotected buildings are experiencing occupancy problems. With NuTone's SecuriCom, you can offer apartment owners maximum protection and flexibility at a very attractive price.

The Advantages.
Since new wiring to individual apartments is not necessary, and apartment speakers are eliminated, (the tenant uses his own phone), installation time and cost are drastically reduced. SecuriCom is compact and simple... just two basic units are installed: a Lobby Directory and a Control Unit. Modular electronics "plug in" to provide easy installation and maintenance, and tenant numbers are programmed in seconds. All of these unique advantages mean NuTone's Apartment SecuriCom can provide maximum communications and security with minimum installation and expense.

What about operation?
If you were impressed with SecuriCom's ease of installation, its operation will absolutely amaze you. Visitors simply pick up a telephone handset from the lobby directory, and press a single button which rings the tenant's regular telephone. After tenant identifies the visitor, he or she simply dials "6" to activate the door release... that's all there is to it!

SecuriCom® offers
All the features you want:
• Adjustable timing for door release
• Automatic door re-locking
• Excellent fidelity for easy recognition
• Dual entrance door capability
• Modular Pushbutton Panel in five sizes to fit number of units in your building
• Postal Lock provision
• Adaptability to any type of building

For the name of your nearest NuTone SecuriCom Representative, DIAL FREE 800-543-8687 in the continental U.S. Ohio residents call 800-582-2030. In Canada, write NuTone Electrical, Limited, 2 St. Lawrence Avenue, Toronto M8Z 5T8.

NuTone SecuriCom... the answer to today's apartment lobby needs.

Show off your store in its best light

Helping you put the right light quietly to work in your store is what the ITT Indoor Lighting lines—Art Metal, Gotham and Wakefield—are all about. Functional and efficient lighting that calls attention to your store and merchandise without calling attention to itself.

Depending on the selling environment you set out to create, we have exactly the fixtures you'll need. The system can include downlights, accent lights, wallwashers, track lighting and general lighting in HID or fluorescent.

Art Metal, Gotham and Wakefield fixtures are designed for optimum performance and efficiency. We have specification services that make the selection process easier. Whatever fixtures you decide on, you'll have high quality lighting that is both aesthetic and practical — designed for ease of installation and maintenance.

To show off your store in its best light, to your best advantage, look to ITT Indoor Lighting: Art Metal, Gotham and Wakefield. Contact us for details.

If we showed you a ¼” ceiling panel that was guaranteed not to sag and offered the same fissured look and sound absorption as standard ⅜” panels, would you be willing to pay less for it?

Introducing Celotex Grande lay-in panels. The reason we make it thinner? We use a better binder—resin, which when cured, is insoluble in water, instead of the conventional starch-based binder. The result: Grande resists moisture, is easier and less expensive to install and easier to transport to the job site. And Grande panels come with a 5-year guarantee against sagging. A specimen of the guarantee will be provided at the place of purchase, or by writing to The Celotex Corporation, 1500 North Dale Mabry Highway, Tampa, Fla. 33607.

Your Celotex representative has all the details.
Or contact T.M. Pariso, Commercial Marketing Department, at the above address.
Year-end figures showed total construction activity in 1976 up 16 per cent from 1975, for a record $107.2 billion, according to the F.W. Dodge Division of McGraw-Hill Information Systems Company. "Since inflation in construction has subsided over the past year," observed Dodge economist George A. Christie, "the 1976 advance of 16 per cent in total construction contract value meant a solid 10 per cent improvement in 'real' volume." But, he added, "the recovery of construction still has a long way to go." Residential building in 1976 was up 40 per cent from 1975, and nonbuilding construction, largely because of energy projects, was up 12 per cent. Nonresidential building, however, though it showed considerable improvement as the year progressed, was off 5 per cent.

Recent changes in tax law threaten to dampen American enthusiasm for design work abroad by disallowing exemptions for overseas earnings. At the same time, IRS has begun to scrutinize employee benefits. Details on page 41.

DOT will study the services architecture and the other arts can offer in the design of transportation systems. The establishment of this task force was one of the last acts of outgoing Transportation Secretary William T. Coleman, Jr. Details on page 38.

AIA has named sculptors Louise Nevelson and Claes Oldenburg recipients of its 1977 Medal "for artistic achievement related to architecture." Other Medalists named by the Institute include Arthur Drexler, Director of the Department of Architecture and Design at the Museum of Modern Art, and the Federal government's Historic American Buildings Survey, for "significant achievement in recording architectural accomplishments." G. Holmes Perkins, FAIA, former dean of the Graduate School of Fine Arts at the University of Pennsylvania, and Barbara Ward, economist and moving force behind the United Nation's HABITAT, will receive medals in recognition of their "achievements in inspiring and influencing the architectural profession."

The National Trust for Historic Preservation has bought a National Historic Landmark for its headquarters. Architects David N. Yerkes & Associates will adapt the Mellon Apartments in Washington, D.C. Details on page 39.

The National Park Service has designated Philadelphia's PSFS Building a National Historic Landmark. According to the designation, the building, designed by George Howe and William Lescaze, "has not aged nor become old-fashined. PSFS was a great structure from the time of its first conception because the bank was willing to permit the best and it hired a fine architect who had the opportunity, rare in any architect's career, to do his very best."

The American Academy in Rome has appointed Bill N. Lacy its new president. For the last five years, Mr. Lacy has been director of Architecture and Design for the National Endowment of the Arts, and earlier was Dean of Architecture and Fine Arts at the University of Tennessee and at Rice University.

A major exhibit, "Women in American Architecture," opened February 23 at the Brooklyn Museum. The collection of photographs, drawings and models, which spans more than 200 years of examples, will also be seen at MIT and at Colorado Springs. Details on page 38.

The National Solar Heating and Cooling Information Center has begun operations as a clearinghouse for data on design and equipment for solar-energy collection. The center was established by the Department of Housing and Urban Development and the Energy Research and Development Administration. Mail requests for information should be sent to Solar Heating, P.O. Box 1607, Rockville, Maryland 20850, and telephone calls may be made to 800/523-2929 (in Pennsylvania, 800/462-4983).

A series of seminars on the management of architectural and consulting engineering firms will be conducted this spring by the Professional Services Management Journal. The title of the day-long seminars include "Motivation and Compensation of Professional Employees," "Marketing to Public Agencies," and "Negotiating with Public Agencies." The series is scheduled for April 13-15 in New Orleans, April 25-27 in Denver and May 2-4 in Newark. Contact: Michael Hough, PSMJ Editor-Publisher, P.O. Box 11316, Newington, Connecticut 06111.

The 1977 Shinkenchiku Residential Design Competition has as its theme "Comfort in the Metropolis." Architect Peter Cook is judge of the competition, which will award more than $3,000 in prizes. For information: Shinkenchiku-sha Co., Ltd., Attention: Editorial Section of The Japan Architect, 31-2, Yushima 2-chome, Bunkyo-kue, Tokyo 113.

The Iranian government has announced an international design competition for the Pahlavi National Library, to be built in Shahestan Pahlavi, the future city center of Tehran. First prize will be $50,000 and the commission. Second and third prizes are $25,000 each, and ten additional prizes of $10,000 each will also be awarded. Registrations are due by April 19. Documents are available for $70 from Pahlavi National Library Project, Committee for the International Competition, Aryamehr Square, 9 Bisotun Avenue, Tehran.
DOT seeks to integrate architecture and transport

A task force has been established to look for ways of ensuring that better architecture, art and design are incorporated into Federally funded transportation systems. Within six months, the task force is supposed to develop a plan to guarantee that all public funds allocated to transportation be spent with “due consideration for their design, artistic and cultural impact.”

Former Transportation Secretary William T. Coleman, Jr., established the task force before he left office. Department officials expect the new Transportation chief, Brock Adams, to consider the task force’s recommendations.

Mr. Coleman’s instructions to the task force were to consider the creation of a National Advisory Board of Design, Art and Architecture in Transportation (NABDAAT). He also wanted the panel to look into ways of financing the architectural enhancement of transportation systems, at the same time pointing out that Federal grants are available to communities for the esthetic environmental enhancement of transportation facilities.

“As a matter of policy,” Mr. Coleman said, “we believe that a concern for good design is an integral part of responsible planning for safe, efficient and economical transportation systems.” He added, “High-quality design will accomplish the broadest transportation objectives and may generate benefits which far outweigh any additional costs.” Therefore, he said, emphasis must be placed on the choice of plans “which embody the finest American architectural, design, and artistic thought.”—William Hickman, World News, Washington.

White paper calls New Town program “poorly designed”

The Federal New Town program launched by the Democrats in Congress in 1968 was “poorly designed and never given the support it needed” during the eight years of the Nixon Administration, in the judgment of a white paper produced by New Communities Administrator James A. Dausch and handed on to incoming Housing Secretary Patricia Roberts Harris.

The 100-page white paper, supported by three appendices, concludes that the New Town program—backed by nearly $300 million in bond guarantees and another $144 million in grants and other commitments—was doomed to failure from the start.

The report took several months to prepare and cost $270,000, including a $244,826 report from management consultants Booz, Allen & Hamilton titled “Management of Past Problems and Alternatives for Future Actions.”

The major flaw, according to the report, was that the program over-loaded the projects with monthly bond interest costs that soared up, for many of the 13 developers, several times the annual cash flow they were able to generate from sales of homes.

The report recommends that future states and localities assume the initiative and responsibility for any government-backed New Towns. The Federal role should be limited to that of catalyst and provider of grants, the report suggests.

While the housing depression dealt a severe blow to the New Town projects, Mr. Dausch concluded that “most of the projects . . . would have encountered serious financial difficulties [which] would have occurred in any event.” The white paper points out that HUD required “unrealistically low cost estimates” and that the projects were “impractical on any scale.”

Major exhibition on women in architecture opens at Brooklyn

An idea of the Architectural League of New York and its Archive of Women in Architecture, and two and a half years of research and design by architect Susana Torre has culminated in the exhibit “Women in American Architecture.” The show, which opened February 23 at the Brooklyn Museum, was funded by the National Endowment of the Arts and the New York State Council for the Arts, as well as by contributions from a number of corporations and foundations.

In addition to examining the work of academically trained architects, this exhibit will encompass women’s other contributions to the built environment as designers and theorists of domestic space, as creators of “symbolic symbology,” and as architectural critics.

The exhibition includes about 100 boards, as well as architectural drawings and models. In time, examples begin with Lady Deborah Moody’s 1645 plan for an Arab settler’s community at Gravesend, New York, and considerable space is given to the influence of women’s magazines on utopian communities on residential architecture.

By far the largest part of the exhibition, however, focuses on the contributions of women as professional architects. Among highlights of the show are the plans of Nana Yang, a native of Shanghai, for her new home in New York. The exhibit will remain at the Brooklyn Museum until April 15, after which it will be shown at the Massachusetts Institute of Technology, Harvard University, and the Colorado Springs Fine Arts Center.

HEW rejects Congressional rules for architectural barriers

A regulatory package to end “discrimination” against the handicapped and remove architectural barriers that hamper their access to schools, hospitals and other public institutions is bouncing back and forth between Congress and the Department of Health, Education and Welfare for want of a signature giving it the force of law.

HEW formulated the regulations, called for by the 1973 Rehabilitation Act, but HEW Secretary David Mathews refused to sign them before leaving office with the rest of the Ford Administration. Indeed, he ignored a Federal court order to sign the regulations and narrowly escaped a contempt citation for that refusal.

Mr. Mathews maintained that more clarification was needed from Congress on such issues as discrimination against drug addicts and alcoholics, and asked Congress for its opinion on these questions.

A spokesman for Mr. Mathews’ successor, Joseph A. Califano, Jr., said the new secretary has not had time to study the issue or to determine whether the regulations should be signed.

One of the major provisions of the package calls for the removal of barriers that hamper access by the handicapped to schools, hospitals or any other institutions that receive Federal funds. That regulation, opponents say, could cost affected institutions millions of dollars to renovate or remodel buildings and other barriers.

Secretary Mathews sent the regulations to Sen. Harrison A. Williams, Jr. (D-N.J.), chairman of the Senate Labor and Public Welfare Committee, asking him to clarify whether Congress intended the bill to be as far-reaching as the HEW regulations call for. The regulations will now be considered by Secretary Califano after Congress reviews them.—Michael Mealey, World News, Washington.
LA studies ways to increase seismic safety of old buildings

The Los Angeles City Council has softened its approach and voted to emphasize rehabilitation in dealing with an estimated 14,000 unreinforced masonry structures that are considered potential earthquake hazards.

In approving a new seismic safety program, the Council disregarded a proposed ordinance that would have required the owner of a structure determined unsafe (except single-family residences) to post a warning sign of earthquake hazard until the building was brought up to code, or demolished. The deadline for such posting or demolition would have been January 1, 1987.

Instead, the new Council plan calls for unreinforced buildings to be identified and cataloged, a special study made to develop an ordinance detailing how they can be improved to meet minimum safety standards, and preparation of an environmental impact report.

The city also will seek financial assistance from the Federal government, along the lines of rehabilitating buildings prior to a disaster rather than after the fact. And it will sponsor legislation to protect long-term, low-interest loans for repairs.

The 14,000 structures—mostly in the central downtown area—were built before 1933, when the Long Beach earthquake occurred. After the quake, new seismic codes were developed to increase structural safety.

Among the 14,000 structures are about 300 public assembly buildings, including restaurants, theaters and churches, as well as commercial structures and residences. While no dollar figure is available for bringing the buildings up to code, the city’s Department of Building and Safety estimates it would run about 80 per cent of what new ones would cost.

For years, organizations such as the Southern California Structural Engineers Association, the Southern California Chapter of the American Institute of Architects, the Los Angeles Section of the American Society of Civil Engineers, and the Earthquake Engineering Research Institute have called for legislation that would require rehabilitation or demolition of the pre-1933 buildings which do not meet modern lateral force requirements.

According to Councilman David Cunningham, chairman of the Council’s Building and Safety Committee, which recommended the new approach, the committee fully recognizes the magnitude of the problem that could result from collapse of 14,000 structures. However, Cunningham said, it believes a balance should be maintained between concern for public safety and the economic survival of a segment of the public.—Barbara Lamb, World News, Los Angeles.

Assault on Transamerica peak fails on lower slopes

On January 30, alpinists Edwin Drummond and Jeff Long made the first recorded attempt on the north face of San Francisco’s Transamerica Pyramid. The ascent failed at the seventh floor, where the fire department turned the climbers back at the end of a six-hour effort. Although a window was removed to allow the mountaineers to enter the building and return by elevator, they rejected this rescue and made their descent conventionally.

Interviewed later by television newsmen, the climbers said they had been moved to the attempt by the technical difficulties presented by the slope—as challenging as some of the better known faces at Yosemite—and by its unusual urban setting. The climb was intended as an exploratory effort toward a more ambitious assault by Drummond, Long and Mrs. Drummond, a two-day ascent of the tower during which the three would converse with office workers.

Though permission for the climb had not been granted, neither Transamerica nor the authorities plan to press charges; fire officials remarked that the climbers were clearly expert.

Drummond and Long are seen here at their first base camp.
New ALL-STEEL 2400 Series helps waiting become a positive experience.

needs to be more definitive. The judges felt, however, that such definition must come from the Legislature, where the AIA now will seek redress.

The question arose last summer when Gwinnett County began the construction of its 11,000-sq-ft fire station headquarters. The AIA filed for a permanent injunction against the county because it claimed the drawings for the $189,000 structure did not have the stamped approval of a registered architect or engineer. After the drawings were stamped, the AIA questioned the registration laws. John A. Busby, Jr., of the architectural firm, Jova Daniels Busby, and president-elect of the Georgia chapter, AIA, says, "It's a test case. The broad interpretation of the registration law now in Georgia does permit architects and engineers to similar practices."

Gwinnett County Fire Chief Ray Mattison explains that in designing the county's fire stations, he and other fire department officials customarily draw a rough sketch of the proposed building, present it to a fire prevention inspector (also a draftsman) who polishes it, and hand it over to the county engineer, J. M. Seeley. Mr. Seeley, a registered engineer in Georgia, redraws the plans, writes specifications and supervises construction. County officials estimate that this practice has saved the taxpayers about $50,000 on the fire station headquarters because persons already on the payroll helped design the building.

The Georgia AIA, according to a spokesman, "has run its course in the courts" and now plans to present a bill to the Georgia Legislature next year. It hopes to have the approval and support of engineers, architects and registration boards in the state.—Brenda Lloyd, World News, Atlanta.

**NCIC lifts ban on labor issues to lobby against situs pickets**

Construction's "single voice" group—the National Construction Industry Council—now has the authority of its members to take positions on labor legislation issues.

Heretofore, the Council banned deliberation on labor issues in the interest of preserving solidarity—both union and non-union contractor groups participate in NCIC affairs. The ban was lifted, however, because all members oppose common-situs picketing legislation that is being pushed in Congress by organized labor.

Immediately after repealing the ban, the Council voted unanimously to go on record as opposing situs legislation, and authorized its legislative committee to contact lawmakers to urge defeat of any situs-picketing bill.

Under the Council's new rules, a specific labor issue must have the concurrence of 90 per cent of the Council members present and voting before a position can be considered. Positions on non-labor legislative issues can be taken with 75 per cent concurrence.—William Hickman, World News, Washington.

**Nigeria's Court of Appeals will have six regional centers**

The present government of Nigeria, a military regime led by Lt. Gen. Olusegun Obasanjo, has promised to return the country to civilian rule by 1979 and has drafted a new constitution to that end. A major aspect of the constitution is the establishment of a Federal judicial system, of which the most important part is the introduction of machinery for judicial appeals.

At present, Nigerian law, which is modeled on English law, is administered by local civil and criminal courts from whose judgments there is no appeal. The government has named Dan Ibeke, a former Attorney General, president of the new system of Federal Courts of Appeal, and has also appointed 12 appellate judges.

At the same time, architects P. I. Nwamu and associates, a firm practicing in both Nigeria and the United States, and Litchfield Grosfield Associates of New York City have been commissioned to develop designs for a network of six regional appellate court centers.

Although the buildings will vary slightly in exterior appearance and ornament—the northern districts of the country are strongly influenced by Moslem culture—they will otherwise be virtually identical (see above), each containing about 33,000 sq ft of air-conditioned space. The structural system will be poured-in-place concrete, with a barrel-vault roof for large open spans in the court rooms and public areas. Exterior walls, in contrast to the exposed concrete superstructure, will be white marble. Large expanses of glass wall will be set well back of the building line to provide shade and a reduction in air conditioning load. Buildings will face en-

**Georgia AIA loses challenge to state registration laws**

Georgia Supreme Court has ruled the contention of the state chapter of the American Institute of Architects that the design and supervision of the construction of a fire station by a registered engineer employed by Gwinnett County constituted unlawful practice of architecture.

Although the judges concurred that engineers "may not freely practice architecture," they also agreed that the Georgia code, which defines "engineer" and "architect" in broad terms,
Take a look at our
New No. 2500 Operable Wall Series

and take a good look at the price

R.W. has always made the finest Operable Wall Systems in the industry... and frankly, we're rather proud of our reputation that has always featured high quality, innovative design engineering, and knowledgeable, prompt service.

Because of advanced engineering technology, R-W now proudly introduces the No. 2500 Operable Wall Series... a wall available with many distinctive features. But most of all, the 2500 is a wall that you can afford. A wall to meet your needs and your budget. The 2500 series wall could well be the answer to that project you have in mind right now.

To obtain more information on the famous R-W "quality and service" at a fair competitive price, return the coupon below or call your nearest R-W branch office—better yet, give a collect call to Dave Wilcox, our Operable Wall expert at (312) 897-6951. Let Dave give you all the details and a copy of our new catalog F-320. Who says a customer can't get more for less even today.

To: Richards-Wilcox Operable Wall Division, 116 Third St., Aurora, Ill. 60507.
☐ Please send me more information on Operable Wall Systems.
☐ Please contact me immediately—we have a specific project to discuss.

A new design a crystal cathedral for California

Today, the Rev. Robert Schuller of Garden Grove, California, conducts five services for a congregation seated in the "power," because the church has 8,000 members in Grove, while its building seating only 1,700. Mr. Schuller has commissioned Johnson/Burgee Architects to design a new cathedral. The faceted building—the star-shaped plan has eight sides, each set at a different angle, and the roof has three different slopes—will be supported by a steel-pipe space truss. The entire building envelope, including the roof, will be glass. The sanctuary, with 25,000-30,000 sq ft, will accommodate 4,000 worshippers on the ground floor and on concrete balconies. The plan provides a parking area at the back of the church for the drive-in congregation. Near the pulpit, a door will allow Mr. Schuller access to a balcony overlooking the parking area.

Caisner/Nathan site a synagogue along a wooded ridge near Memphis

The site of Temple Israel in Memphis will enter their new building via a glass-covered atrium and a skylit gallery. In addition to the 1,336-seat sanctuary, the temple's facilities include a 250-seat multipurpose social hall, museum, library, offices and classrooms. Behind the sanctuary, a patio shelters the old bimah and an amphitheater. Caisner/Nathan has sited the structure on the 30-acre site to preserve as much as possible of the ridge's undulating contours and an impressive stand of oaks, hickories, dogwoods and magnolias. Archival Goodman served as the consulting architect.
The gap between knowledge and documentation had to be closed.

And building designers and others had to be provided with a way to easily use the new proof.

Not easy tasks. But critical ones in an era when the energy performance of buildings is a matter of the highest priority.

For thousands of years people have known that buildings with masonry walls were more easily kept warm in winter and remained cooler in the summer. The reason was obvious: masonry walls both stored and slowed down the passage of heat, making interior climates more stable. A simple, observable fact. But no longer sufficient.

Designers and owners needed to know how much better masonry conserved energy than did competitive materials and systems. And they needed a simple way to calculate the differential.

Only then could masonry's superior thermal performance be reliably taken into account in meeting energy conservation goals and requirements. Only then could heating-cooling equipment be more accurately sized to save money on both initial and operating costs.

Disdaining "claims" without documentation, the masonry industry began a broad research project to quantify the relationship of the mass or weight of masonry walls to the transmission of energy. The masonry industry engaged a highly qualified firm of consulting engineers (Hankins & Anderson, Inc.) to conduct the study. Ten different walls ranging in weight or mass from four pounds (19.5 kg/m²) to 116 pounds (567.5 kg/m²) per square foot were specified for analysis in 10 widely varying climatic conditions. And in eight solar orientations.

Researchers used a special computer program built around the "response factor" method adopted by the National Bureau of Standards Load Program along with other computer programs. They analyzed U.S. Weather Bureau data and considered the effects of many variables, including the weight of walls, on thermal performance.

Results of the computer analysis showed:

- Traditional "U" value measurements of the thermal performance of walls are inadequate. They are based on the incorrect assumption that energy transmission occurs in a "steady state." Contrarily, the process is dynamic and varies greatly in relation to many factors, one being the weight of walls.
- Steady-state "U" value measurements therefore may often result in the oversizing of heating equipment for buildings with masonry walls (and the undersizing of such equipment for buildings with lightweight walls).
- The difference between steady-state and dynamic measurements can be accounted for by the use of a correction factor—the "M" factor—in making heat gain and loss calculations.

The consulting engineers' report and data consisted of 460,800 numbers on 2,200 pages of computer print-out. Important as this proof of the superior thermal performance of masonry walls was, it was not enough.

The task of developing a tool for the easy use of the findings remained. Masonry industry engineers began studying and correlating the data to provide a simple correction factor for dynamic analysis.

The result: An easy-to-use "M" factor graph or curve.

Only two numbers are required in order to use the graph: the number of "degree days" in the locale (obtainable from the U.S. Weather Bureau) and the weight per square foot of the wall. The graph can then indicate the appropriate "M" factor modifier, or correction factor, to be applied to steady-state "U" value measurements. A more accurate measurement of the dynamic thermal performance of walls results.

The graph shows that in all cases, masonry walls perform better than lighter weight walls with the same "U" value rating. The heavier the wall, the greater the differential.

Results of the masonry industry study and the "M" factor graph have been submitted to the Conference of American Building Officials (CABO). And CABO has agreed that the effect of mass should be considered in making heat gain/loss calculations.

The "M" factor study findings are contained in a new Masonry Industry Committee publication, Mass, Masonry, Energy. With the findings are graphs and charts, and an explanation of how to use them. An all-in-one booklet—everything you need to know in order to take advantage of the superior thermal performance of masonry walls.

We're proud of the new proof that masonry walls save more energy than walls of competitive materials with the same "U" values.

We're proud of the fact that the masonry industry decided to produce this proof, rather than simply make a claim.

But our pride isn't important to you. What matters to you is that we've made it possible to design, build and operate buildings that will save energy and money.

We've got the proof. Just write for it at the address below:

The Mason Contractors and Bricklayers Union of the USA & Canada.

ARCHITECTURAL RECORD March 1977
The 25th anniversary of its honor awards program, the Seattle Chapter, AIA, commends 11 buildings.

Glasstex. A beautiful, fiber glass-based asphalt roof that combines a 25-year limited warranty, Class "A" fire rating and cost efficiency.

Glasstex offers you natural-looking beauty. It's a textured shingle that comes in five earth-tone colors (that's Bronze Brown shown below).

And Glasstex is a rugged, self-sealing shingle that stays new-looking longer. Its fiber glass base means dimensional stability, plus

resistance to blistering. And it's a Class "A" shingle—to meet your fire- and wind-resistant requirements.

The fact is, Glasstex costs less than many conventional Class "A" roofing materials such as metal, tile, slate, or 325 lb. asbestos-based shingles. It's lighter too (260 lbs./sq.), for easy installation and reduced structural requirements.
and every Glasstex roof is covered by a CertainTeed 25-year limited warranty against facturing defects.

Glasstex is one of four CertainTeed Protectors—a line of fiber glass-based Roofs that also includes Countrycut, Glassguard, and Glasscraft. We'd be happy to tell you details—warranty terms, colors, and specifications on the whole "Protectors" line.

Just write to CertainTeed Corporation, P.O. Box 860, Valley Forge, Pa. 19482. Or consult your 1977 Sweets Manual under section 7.7/Ce.

(Glasstex, Glassguard, Countrycut and Glasscraft are trademarks of CertainTeed Corporation.)

It can take just about everything people splash on it — and come back again for more!

A WATER BASE HIPAC* coating featuring more

PLUS all these features

APPLY BY ROLLER, SPRAY OR BRUSH.

LOW ODOR DURING APPLICATION. YOU CAN WORK WHILE PAINTING.

TOUGH, DURABLE RESISTS SOFT AND CHEMICAL ABRASION.

MEETS FEDERAL SPECS. TT-C-001979 (GSA FSS)

* High Performance Architectural Coating
It's the pay-off end of a Halsey Taylor water cooler. Our exclusive double bubbler—only twin stream projectors in the business.

Sure, it gives fuller, more generous gulps of cold water. But it also identifies the cooler beneath it as the one specified more often than any other. Simply because architects specify on it. From past experience.

We pay a lot of attention to product appearance—of course. And produce the widest selection of models and colors in the industry—to give you the greatest possible design latitude.

But performance is what we're really hooked on. So we use finest quality materials. Components, assemble them scrupulously, test them thoroughly and turn out coolers that give year after year of maintenance-free service. Depend on Old Faithful.

If you'd like to have a new catalog, write Halsey Taylor Division, King-Seeley Astron-Thermos Co., Route 75, Freeport, Illinois 61032.
AN ANSWER THAT MAKES THE DIFFERENCE IN SYSTEMATIC SHAFT ENCLOSURE

Faster/easier enclosure
The Gold Bond I-Stud Cavity Shaftwall System has just two basic framing components—the I-Stud and "J" track. Exclusive built-in tabs on I-Studs permit continued visible check during installation, assuring positive engagement and alignment of the 1" Fire-Shield Gypsum Coreboard in studs on 24" centers.

Greater versatility
These same advantages apply whether you're enclosing elevator shafts, stairwells, or vertical chases. On elevator normally applied on both sides. Weight of the finished system using two layers of ½" wallboard is approximately 10 pounds per square foot of wall. The system withstands positive and negative air pressure forces exerted by high-speed, hi-rise elevators, and has a two-hour fire rating and STC ratings of 41 and 48. For complete details and specifications consult your Gold Bond representative. For answers...now...phone, telex, telecopy, see Sweet's Architectural Catalog File 9.6 Go or write Gold Bond Building Products, Division of National Gypsum Company, Dept. AR2, Buffalo, New York 14202.

Three-way savings
Enclosures can be completed quickly, at early stages of building construction, under most conditions in which installers can work. The system delivers substantial savings, not only in time, but in space and weight.

Two men can enclose elevator shafts, floor to floor, from the corridor side, without special rigging or scaffolding.
"We have chosen not to cut the top of the buildings off in the usual fashion against the sky, but rather to silhouette a counterpoint of strong diagonal massing."

— Philip Johnson, Architect.

(1) The use of stub-girders enables the air-conditioning ducts to be carried through the built-up girder system without requiring any web penetrations. The stub sections act compositely with the 3-1/4-in.-deep concrete topping placed over the galvanized steel floor deck.

Each trapezoidal tower measures 120 ft wide, a maximum of 250 ft on the long side, and 130 ft on the short parallel side. The fourth side is angled 45 degrees to the parallel sides.

(2) An eight-story glass-enclosed courtyard connects the towers at their base. The see-through enclosure provides continuity of design, as well as an airy, visual experience for persons entering the building.
ENNZOIL PLACE...showcase for steel construction

"Girder" design provides construction economies; reduces overall story height.

Pennzoil Place, designed by Johnson/Burgee and S. I. Morris associates, adds a bold, new architectural dimension to the Houston skyline. Rising 516 ft above grade, the twin, 37-story, hyperbolic paraboloid towers of Pennzoil Place contain a total of 1.8 million sq ft, making it the city's largest office complex. A retail and a three-level garage are located below the plaza level.

Speeds construction. The project's building program was driven by a 24-month construction schedule. Several basic assumptions were considered during the early design phase, but steel was selected because of its ability to be erected more rapidly.

The system adopted utilizes a welded rigid steel frame on the perimeter, and concrete shear walls in the core. Three additional steel bents, located near each 45-degree corner, minimize torsion.

According to the engineers, "The steel frame was erected quickly and was well coordinated with the construction of the core." The stub-girder system cuts material cost. The stub-girder floor-system, a relatively new development in structural design, offers a number of advantages. Buildings with a minimum height of 100 ft and clear spans in the range of 35 to 40 ft.

The stub-girder concept resembles a Vierendeel truss system. The composite concrete and steel floor deck system forms the top compression chord of the Vierendeel and a high-strength steel section forms the bottom tension chord. Stub pieces, shop-welded to the bottom tension chord and connected to the composite concrete and steel floor deck system by welded stub-type shear connectors, serve as the verticals of the Vierendeel.

The unusual floor-framing system enables the air-conditioning ducts to be carried through the built-up girders without requiring any web penetrations. This increases the structural depth of the girder without adding a penalty for increased height. Result: significant economies in structural steel. It's estimated that stub-girders reduce structural steel quantities by approximately 2.5 lb per sq ft compared to conventional framing systems.

And because building height is reduced, savings result in other construction items, such as curtain walls, elevator ropes, and electrical and mechanical equipment.

What's more, because the continuous floor beams can be easily positioned atop the girders, erection proceeds more rapidly than usual.

Our Sales Engineering Division offers a variety of technical and advisory services. For example, our preliminary framing analysis program is designed to help you select the most favorable steel framing system for your building. It also enables you to compare steel framing against competitive materials.

Caribbean by American Olean.

We got the colors where we get the tile: from Nature.

Open your eyes to the beauty of a natural material like real ceramic tile. In colors that deserve to be called Caribbean.

There's a green as bright as the foliage in a tropical forest. A brown rich as wet earth. An orange hot as the blaze of a sunset. And many other natural shades that rival the real thing. In both bright and crystal glazes.

But try not to let all this brilliant color blind you to the fact that although Caribbean ceramic tile is lovely to look at—it's also a really practical material, too.

You can use it on interior walls and interior residential and moderate duty commercial floors. It requires a minimum of care. And it'll last long after other materials have already started to show their age.

Find out about all the natural advantages and beauty of Caribbean today. Write to American Olean Tile Company, 2400 Cannon Avenue, Lansdale, Pa. 19446 for a free brochure.

Caribbean Ceramic Tile.
It's the natural thing to use.
spite of the controversy, A201 basically reaffirms traditional practices

Arthur T. Komblut, Esq.

In the penultimate draft of the 13th edition of A201, a new section, 13.12, was added to the 13th edition during the summer months of 1976. AIA and CSI chapters around the country and numerous construction industry associations became forums for discussing the various changes to the A201 document. These meetings have served the construction industry well for many years. Having participated in a number of these meetings, as well as having read the many documents and analyses of the new A201, it is safe to say that the new A201 is improved, more controversial, and requires more study.

Para. 1.3, which relates to the architect's ownership of the documents, has been improved considerably. Language has been added to protect the architect's common law copyright in the documents he prepares when they are submitted to regulatory authorities in the course of securing approvals for the project. The case law has been divided on this particular issue, and the inclusion of this new contract language will be helpful in preventing unauthorized use of the documents.

On the architect's role during construction...

In Article 2 relating to the architect's role during the construction phase, a minor semantic change was made in Subp. 2.2.3. Rather than being required to make "periodic" visits to the site, the architect now must make visits "at intervals appropriate to the stage of construction." The impetus for this change was nothing more than a recognition that the common dictionary definition of "periodic" could be interpreted to mean visits at regularly recurring intervals. In accordance with normal practice, most architects visit the site whenever they feel it is necessary, in their professional judgment, to perform their required duties, rather than on some arbitrarily set schedule as would be imposed by a literal interpretation of "periodic." Thus, this change simply brings the written contract into conformance with customary practice and does not lessen in any way the architect's responsibility.

Subp. 2.2.4 has been reworded to include a new provision that the architect's responsibility is as described in the new A201, which has appeared in almost identical form in numerous prior editions, merely sets forth a contractual right to the owner and contractor that the architect is not responsible for the contractor's functions.

Para. 1.3, which relates to the architect's ownership of the documents, has been improved considerably. Language has been added to protect the architect's common law copyright in the documents he prepares when they are submitted to regulatory authorities in the course of securing approvals for the project. The case law has been divided on this particular issue, and the inclusion of this new contract language will be helpful in preventing unauthorized use of the documents.

On the owner's obligations...

Article 3 relating to the owner's obligations contains two major changes—one beneficial and one highly dubious. The questionable change appears in Subp. 3.2.1. A new provision that requires the owner to give the contractor "reasonable evidence" of his financial arrangements for the project. Failure by the owner to provide this evidence will excuse the contractor from entering into the contract. While it may seem reasonable for contractors to want financial assurance, there is considerable doubt about the willingness of owners to voluntarily proffer this information as a condition of the contract. This new provision has not been challenged by the courts.

**Alcoa Alply Insulated Panels offer you custom design flexibility.**

**Why settle for less?**

If aesthetic freedom and energy conservation are important to you and your client, then we suggest you contact us for your nearest Alcoa Alply panel regional distributor, who offers you single-source responsibility — everything from engineering to the completed wall system, in place, with integral fenestration, interior and exterior finish and thermal insulation.

No other insulated modular wall offers all these choices for low- to middle-rise buildings:

- Exterior and interior skins: aluminum, stainless steel, Hardboard, plywood, cement-asbestos — you name it.
- Finishes: four standard finishes and 18 colors, including Super Alumalure baked-on, factory-applied fluoropolymer enamels... Alumalure baked-on synthetic resin enamels... Alumilite electrolytic coatings in natural aluminum... Duranodic hard-coat finishes in three integral bronze shades and three new integral gray shades.

Panel cores: polystyrene, polyurethane, isocyanurate, or other materials, depending upon project requirements.

- Wide range of panel sizes: up to 5 feet wide, 18 feet long.
- Variety of shapes: panels can be shop-formed to almost any three-dimensional shape desired.
- Choice of joining systems: Alcoa’s patented Snug Seam caulking, splines, battens or frames.
- Variety of cutouts possible: to accommodate windows, doors, sloping grade lines, walkways, difficult contours, parapets.

Whatever you’re designing, let our regional Alcoa Alply panel distributors help. They know a great deal about wall systems, finishes, industrial roofing and siding and other low- and middle-rise construction problems. For further information, write: The Stolle Corporation, Aluminum Company of America, 1075-C Alcoa Building, Pittsburgh, PA 15219.

Running your personal financial strategy

Mark Pollard

In interviewing a number of architects around the country, the author learned—not unexpectedly—that their paramount personal financial concern is to become more financially independent. In addition, younger architects often cannot initially afford to take the risks associated with investing in common stocks. This article—the first of two on personal investment—is one in which the investment counselor’s opinion of how a hypothetical architect* could begin amassing the capital required to take the bigger step into sophisticated investment programs. The strategy: a combination of conservative investments that will allow capital growth at a greater rate—with a minimum of risks—than if the architect had all of his discretionary income in a savings account. Next month, we will examine the investment programs available to the senior architect who has amassed capital and is saving on a regular basis.

By Cooper (our hypothetical subject) is a 2-year-old architect who is married and has two children. Like most architects, Andy’s main concern is to become more financially independent. In this regard, he is certain about two things: 1) he wants to add to his current income; and 2) he wants to maximize the return on the $15,000 he recently inherited.

First, let’s look at his current situation. In 5 years Andy and Linda earned $41,000. The vast majority of their income, $26,000, comes from Andy’s position with an eight-person firm, where he has a small interest (3 per cent). He earns $5,000 per year.

The Coopers don’t know why, but despite their substantial income, they cannot seem “to save.” Fortunately, they are able to meet their current expenses, such as their mortgage payments, including mortgage insurance, their automobile payments as well as a small but significant separate insurance policy of $35,000. However, after the Cooper’s pay their current expenses, what they think of as “savings” (the portionary income of $100-150 a month) is not going into a savings account.

4. Open a savings account

For a retirement account

The first problem for Andy and Linda is to solve their inability to save money on a regular basis. The solution to their problem is to learn the discipline of an organized investment program. By organized, I mean the saving of a fixed sum on a monthly basis. Should Andy and Linda begin saving $100 per month in a savings account at a 5 per cent interest rate, compounded daily, they will have put aside $2,315 in the first year alone, and will have saved $3,652 at the end of 20 years. Table I shows the amounts they are likely to have saved over a period of 10 and 20 years.

An extension of the savings principle is an Individual Retirement Account (IRA) for both Andy and Linda. Fortunately, Linda has an IRA account in her local savings and loan where she initially deposited $500 at the end of 1976. Since a contribution of up to 15 per cent of your earned income (to a maximum of $1,500) is allowed in an IRA, Linda could have contributed $750 to her program. One of the major advantages of an IRA is that the taxes on any earnings or gains accumulated through the IRA are deferred until your retirement, when you are likely to be in a lower tax bracket. A division of capital investment can yield well without risks

The other conservative discipline required in successful asset management is to maximize your investment return within the guidelines of the risks you are willing to assume. In Mr. Cooper’s case, the most important objective is to preserve his $15,000 in capital and earn a better rate of return than is currently available in his savings account. Andy agrees he doesn’t want to get rich quick or take the risks associated with investments in commodities, options or real estate. Due to the limited amount of capital, I suggest that he defer buying common stocks until his investable capital is about $25,000.

To meet the objectives of capital and maximization of yield, I recommend that Andy divide his commitments into thirds. Using this approach he can invest one-third of his capital ($5,000) in savings certificates at his local savings and loan. The certificates are purchased in $1,000 denominations and would best be bought with staggered maturities from six months to 2½ years. In this way Andy will always have $1,000 available for re-investment and, if required, to meet a family emergency. At current rates Andy will earn an average of 6½ per cent or $317.50 annual income. Table II shows the effect of compounding Andy’s investment returns for 12 years and 22 years.

Another third of Mr. Cooper’s investable assets or $5,000 should be invested in a five-year quality corporate bond. This investment should be directed by the major rating services—Moody’s and Standard & Poor’s—and should not carry a rating below Aa. These are bonds of the highest quality and will allow for the timely investment of interest and principal. Currently these intermediate term bonds pay approximately 7 per cent on an annual basis.

The last third of Andy and Linda’s money should be placed in a 10-year corporate bond. This bond should also carry an Aa rating or better, but it should not be issued by the same company as the five-year bond. A 10-year corporate bond issued by a major industrial company is currently yielding approximately 8.20 per cent or $410.00 per year.

Two points should be made here: 1) diversity of conservation assets is important to a person in Andy’s position, and 2) any program of this nature should be reviewed at least once every two years.

* Our profile is based in part on the 1974 Case and Company, Inc. report, "Survey of the Membership," commissioned by The American Institute of Architects. The report states that the typical AIA member is a white male about 46 years old and married, with an average of three dependents. The average salary received by AIA members in 1973, including profit sharing, was $26,630. The author’s research revealed that the wives of most of the interviewed architects work either part- or full-time.

Pollard is a senior account executive with Merrill Lynch, Pierce, Fenner & Smith, Inc., New York.
Elegant, easy-to-maintain washrooms in the Sacramento, California, Civic Center include Bobrick stainless steel washroom equipment and laminated plastic toilet compartments. Bobrick paper towel dispensers are recessed into the mirrored wall. Large capacity recessed waste receptacles meet the demands of heavy traffic flow. Soap dispensers are conveniently mounted on the lavatories. Laminated plastic toilet compartments defy graffiti and corrosion. With concealed stainless steel hardware and uniform thickness of doors, wall posts and stiles . . . these compartments have a distinctive "flush-front" appearance.

An automated project control system aims for improved profitability

Neil Harper

In the early fifties, just over 20 cents of every dollar of gross billing was retained as before-tax profit by architectural firms. This profit margin has steadily decreased over the past twenty years. It is estimated that today profitable firms estimate the margin closer to 5 to 10 per cent. Rising labor costs outpaced limited increases in professional fees, and the scope of services offered to clients has expanded far beyond the capability of human beings. Yet, the two factors alone-increased costs and scope of services-have placed the onus on architects and engineers to develop improved systems of compensation and control. Architects and engineers must place the burden of developing improved compensation and control systems on the architects and engineers to the industry.

In its April 1975 publication of “Compensation Guidelines for Architectural Services,” the American Institute of Architects issued a report on a rational and equitable basis admits to both architects and engineers for defining cost-based compensation. This action in effect, emphasized the comprehensive nature of architectural services, while offering a new alternative to fee schedules that had been abandoned under the new guidelines. The American Institute of Architects (AIA) has recently reissued its guidelines for architects and engineers, with a spring publication, entitled “Compensation Guidelines for Architectural and Engineering Services.”

Implicit in this compensation development format is a format for monitoring design costs, and overhead and all overheads are collected. Further, these costs can be captured. The Computer-Based Financial Management System (CBFM) operated by the Cambridge, Massachusetts, consulting firm of Harper and Shuman, Inc., is a national computer accounting system that has been recently released to accept the cost-based compensation budget data and provide the architect with periodic “Project Progress” reports to compare actual expenditures with the budgeted amounts. The report is based on a computer generated by the architect and is visible through a computer terminal according to the report's guidelines manual. Figure 1 represents a report developed in a prototype City Hall project, summarized department by department and phase.

Both hours and dollars are presented for the current period and for the project-to-date. The report includes direct labor, overhead allocation, and direct and reimbursable costs. The estimated per cent of work completed, as reported by the project manager, is used to predict the total budget to give the “Earned Budget” column. This Earned Budget can then be compared to the “Spent to Date” column to provide a ready assessment of each labor or expense item (see boxed areas). An alternate comparison is also offered in the column, “Expected ($ vs. Reported (hours))” per cent of work completed. When the expected amount exceeds the reported amount significantly, corrective action of some sort is required.

An optional feature of the Project Progress Report is the presentation of financial data at the bottom of the report. The top part of the report shows the costs of service provided; the bottom part adds information dealing with compensation: commission size (compensation), earned income, billing, and profit or loss.

A second report monitors firm-wide profit plans

Principals and project managers in most firms tend to think of their firm's activities and performance as a series of projects. It is also true, however, that firm-wide performance is often presented in terms of income/expense statements which is based on a general ledger formulation of data; rather than based on a project-by-project formulation.

Figure 2 is such a presentation: a “Profit Planning Monitor” report showing a firm-wide profit plan in terms of income and expense items. In the example shown (see boxed areas), the Annual Plan has budgeted $860,000 for income, $688,000 for total expense, and $172,000 for profit for the total year. Through March 31, this should have resulted in a $34,400 profit, but only $24,147 was actually generated, due primarily to overruns in the indirect expenses (by $7011).
Walls should always be attractive. But on commercial applications beauty is only part of the story. Code Requirements. Design flexibility. Durability. The Marlite Division looks at the wall from a commercial viewpoint. Marlite Brand Plank and Paneling is available in an array of beautiful finishes including deeply textured and richly embossed woodgrained designs that look and feel like the real thing. They're fire-resistant, abrasion, stain, and scratch resistant, and meet sanitation requirements. Plank is tongue and groove. A unique 16" product in 8' and 10' lengths for total design flexibility. Create herringbone, diagonal, and horizontal patterns with virtually no waste. Paneling is available in the plain and fancy including a specially styled, subtle-sculptured exotic series. And a Class-A rated, U.L. Listed, Fire-Test® System. Marlite Brand Plank and Paneling. Not an imitation. An improvement. Particularly from a commercial point of view. Write Marlite Division Commercial Sales, Dover, Ohio 44622. Phone (216) 364-8854.

Marlite® MEETING THE CHALLENGE OF CHANGE
Lodge/Sweet’s construction outlook, 1977: first update is looking bigger by the minute

The outlook for total construction contract value for 1977 is now even stronger than it was just a few months ago: a record $123 billion—up 15 per cent, with gains in nonresidential, residential building construction. Public works spending, the time-honored means of creating jobs during recessions, will be escalated. With $2 billion already granted under the Local Public Works Act of 1976, Mr. Carter would add another $2 billion to the current year’s authorization, and also extend the program through fiscal 1978. (Otherwise, it would expire September, 1977.) Housing is an area where the Carter Administration hopes to accomplish two goals at once: stimulating economic activity while improving urban living conditions. Specifics have not been announced as yet, but some form of inner-city housing aid is a good bet.

The National Construction Contract Value (millions of dollars)

Taking our first cut at a 1977 construction forecast late last year (record, November 1976, page 65), we came up with a rather optimistic outlook (+12 per cent over 1976)—but with more than the usual qualifications. There didn’t seem to be much doubt about the direction that construction markets were heading, but the strength of the further expansion of construction’s already-established recovery depended on three things: 1) a reversal of the mid-1976 “pause” in general economic activity; 2) a change in national priorities and programs; and 3) relatively dormant inflation.

Since October 1976, we’ve moved along nicely in all three areas. Last year’s spasm in the economy’s recovery worked itself out before year-end, giving 1977 a new start in the right direction. Leadership passed to Mr. Carter who proposes to encourage rather than restrain the recovery from here on. And inflation, after three horrendous years, finally receded to its pre-energy crisis rate. With all three major conditions of our earlier forecast for 1977 satisfied at the start of the year, there’s little left to do now but raise our sights.

The economy: the push after the pause

Last year’s “pause” made its point very effectively: you can’t take recovery for granted. For an uncomfortably long time, a recovery is vulnerable to stalling out, as this one did. Such vulnerability continues to exist until the recovery reaches the point of being self-sustaining, and that point is reached when business capital spending finally takes over as the driving force of expansion.

Right now, with considerable excess capacity throughout most industries, we’re still quite a bit short of the self-sustaining point, and the case for stimulative monetary and fiscal policy in 1977 is every bit as valid as it was in 1975 and 1976. In fact, with inflation at its lowest rate in a long while, this could be the ideal time to close the gap between actual and potential production. Closing that gap is, after all, what creates the incentive for increased capital spending, which is, in turn, the key to growth, productivity, and price stability.

The President’s package: modestly activist

Only time will tell whether Mr. Carter’s $30-plus billion package of economic measures, which includes a variety of taxation and spending stimuli, will be too much, too little, or just enough prodding to guide the economy back toward full use of our resources. It cer-
THOROSEAL®

Building Activity

The intangibles that go along with this Administration—a realignment of national priorities that puts economic growth ahead of anti-inflationary restraint, and a cooperative relationship between the White House and Congress—could turn out to be even more important than specific programs. They strongly suggest that things will start happening in Washington—a place where not much has been happening lately. And history shows us when things happen in construction, too.

Nonresidential building: the indirect boost

In 1976 it was energy, not anti-recessionary spending, that gave rise to the strong gain in nonresidential construction. In 1977, however, it will be highways, sewers, and other public works—supported by increased Federal spending—that will keep things moving ahead.

Last year brought a record number (30 vs. 25 in 1975) of increasingly costly ($50 million each vs. $325 million) electric generating projects. The result: contract value nearly doubled last year to $18 billion, and that’s even more than we had been expecting for 1977. This year’s utility forecast has been duly expanded to $16.5 billion.

As 1976 drew to a close, public works construction was just beginning to respond to last October’s special appropriation of $2 billion to increase employment in construction, and our earlier expectation of a strong rate of contracting for roads and sewers during the first half of 1977 still holds. However, the previously expected second half decline has to be postponed in view of the Carter Administration’s intent to extend Congress’ “quick fix” through all of 1977 and into 1978 as well. Roughly one-third of these special public works funds are being directed into highway and sewer construction, raising 1977 totals to $9.3 billion and $7 billion respectively.

Residential construction:

in 1976 was of the lottery type, with $2 billion special appropriation under Public Works Act of 1976 indicates temporary change in this situation. Instead of the usual works money running heavily to the usual roads and sewers projects, a surprisingly large share (60 per cent) is being used for construction of nonresidential buildings. And of that share, nearly one-third involves school building or remodeling. In both 1977 and 1978 these public funds will temporarily pump new life into the sluggish institutional building market, and so we’re increasing this year’s estimate to $17 billion.

Institutional building: 2 million units soon?

The October, “standard” forecast of housing starts for 1977 has escalated from 1.7 million units to 1.8 million. One reason: the seasonally-adjusted rate of housing starts actually averaged 1.8 million during the final quarter of 1976. Another reason: the Carter Administration is expected to take a continuating active role in housing markets.

Depending on how much shelter demand is satisfied by mobile homes, the optimum annual rate of site-built residential construction for the rest of the decade lies in the range of 1.8 to 2.0 million units. Considering the low output of the past two years, this potential demand implies a good probability of a 2 million-unit housing year in the near future—most likely in 1978, following this year’s advance to 1.8 million. However, the mix of the housing supply will change in 1977 to include approximately 600,000 apartment units—up sharply from less than 350,000 in 1976.

Nonbuilding construction: it goes up too

In 1976 it was energy, not anti-recessionary spending, that gave rise to the strong gain in nonbuilding construction. In 1977, however, it will be highways, sewers, and other public works—supported by increased Federal spending—that will keep things moving ahead.

Architectural Record
You'd think we just got into the jewelry business.

It glistens and shimmers like a finely-cut gem. Chrome or crystal handles have hot and cold indexing. The twelve-sided shape means maximum grip for wet or dry hands.

There's never been a fitting like the new Heritage. Inside is the famous Aquaseal® — the most reliable valve you'll ever install.

It never needs stem repacking. Working parts just won't corrode.

See your American-Standard representative about Heritage fittings. And expect the best. Because that's what American-Standard is all about.

And that's why we're a household name.

At Raynor we give it to you straight ...and that's the way it stays!

Most overhead type doors look great when they're first installed. But given time and plenty of ups and downs they begin to sag in the middle.

Raynor doors won't sag...and for a very good reason: U-Bar reinforcement. We engineer and fabricate this special reinforcement in our own plant for all extra-wide doors.

It's this extra concern for quality that's made Raynor a brand you can depend on for residential, commercial and industrial doors made of wood, aluminum, fiberglass or steel.

Call us for more specifics. 815/288-1431.

Or write Raynor Manufacturing Company, Dept. AR, Dixon, IL 61021, for the name of the Raynor factory-trained distributor/installer near you.

Super-C Steel Framing can make your whole job go up faster.

Super-C Steel Joists and Studs, developed by U.S. Steel, are pre-cut and pre-engineered for quick erection.

They're strong, so you can use fewer members—and spacings can be wider (usually 24" O.C.). Wall sections can be pre-fabricated, on or off the site, and set into place as a unit.

Both joists and studs are pre-punched at specified intervals to speed wiring and plumbing. With less labor cost and virtually no waste in the field, your in-place costs can be lower than with other framing systems.

What's more, you should cut your callbacks to nearly zero—since Super-C members don't shrink, warp, or rot. They're also non-combustible—and Super-C Steel Framing assemblies can have 1-hour and 2-hour fire resistance ratings.

They work well with any form of construction. Use them separately—or as a complete framing system.

For more information, see our catalog in Sweet's Architectural File (5.3/Uni). Or mail this coupon for a detailed booklet on both Super-C Steel Joists and Steel Studs—plus the name of an independent licensee-fabricator serving your area.

New Flor-Ever is commercial flooring at its best—designed like no other floor to meet changing commercial needs and demands, including virtually seamless installation in most applications.

Flor-Ever is a maintenance saver. Its availability in 12 foot widths for seamless or minimum seam installation means fewer soil traps and easier, faster cleaning. Fewer seams also mean faster, more dependable installations.

Its no-wax finish cleans easily, and gentle embossing enhances Flor-Ever texture but doesn’t trap soil. Its extra-heavy commercial wear layer tests at new highs in resistance to abrasion and the problem stains in health care, food service, school, office and beauty shop application.

Great design and color workability. Flor-Ever is an appealing texture of subtle colorations to blend with any commercial interior. A broad, eight-color range meets beautifully with today’s and tomorrow’s most popular commercial trends in color and design.

Flor-Ever meets the specification requirements of F.S.-L.F.-001641, Type III, Class 1, and F.H.A. Minimum Property Standards for Single Family and Multi-Family Units. Meets H.E.W. requirements under the Hill-Burton Act with smoke generation of 450 or less. Flame Spread ASTM E-84 Tunnel Test of 75 or less, Class B rating with 0 Fuel Contribution. Installs on, above or below grade.

Consider all of the exceptional advantages of new Flor-Ever at a cost close to VA tile, and it makes sense to consider it for your next installation. For specifications and your sample book, write or call Contract Sales Manager, Congoleum Corporation, Resilient Flooring Division, 195 Belgrove Dr., Kearny, NJ 07032, (201) 991-1000.

When Hewlett-Packard selects you to supply building systems

It started with a building in Cupertino, California. Hewlett-Packard combined Vulcraft's computer designed steel joists and joist girders with a fast-track construction schedule, and helped shave two months off the construction time of the building.

This shaved the costs. Not just because the lightweight nature of steel joists and joist girders makes them easier and faster to erect than other, heavier systems. But also because supporting columns can be placed further apart. And foundation size can be decreased.

All of which makes the Vulcraft system more economical than traditionally fabricated structural steel system. Simply because it's lighter. And faster.

So much faster, that buildings like those constructed for Hewlett-Packard can be delivered to the

Because electrical and mechanical systems can pass through the open web of the joists and joist girders, installation goes quicker. And changes can be made more easily when needed.

The high strength to weight of steel joists and joist girders can provide increased clear span areas, because supporting columns can be spaced further apart.

Although the Hewlett-Packard buildings Vulcraft system have basically the same design, the exterior features vary.

They expect results. They got them from Vulcraft, all six times.

The Vulcraft system can work just as well for you. To learn how to speed up your work, contact your local Vulcraft representative for your Joist and Joist Girder Specification Guide. Or write Vulcraft, P.O. Box 17656, Charlotte, North Carolina 28211. Or call 704/366-7000.

We have the know-how. And we have five plants located around the country to make sure your deliveries are on time. So your building can be ahead of its time.

VULCRAFT
A Division of Nucor Corporation

The Hewlett-Packard facility in Cupertino, California, the first of six to use the Vulcraft system.

The versatility of designing with Vulcraft steel joists and joist girders helps meet complex design requirements like this unusual eight foot interstitial floor space.

Vulcraft joists and joist girders can be designed to easily accommodate all lighting, heating, air conditioning, wiring, duct and pipe requirements.
New USG® Z-Furring Channels build a positive case for energy savings!

- **POSITIVE ATTACHMENT.** Gypsum panels screw to Z channels that attach directly to concrete; hold more securely than systems with metal over insulation where "fishhooking" of pins can occur.
- **POSITIVE FIRE PROTECTION** is the direct result of this extra security attachment system.
- **POSITIVE FASTENER COST REDUCTION.** One size concrete fastener used for all thicknesses of insulation.
- **POSITIVE THERMAL TRANSFER REDUCTION** is afforded by the exclusive slotted design of these superior furring channels.

USG Z-Furring Channels are now available in 1”, 1½”, 2” and 3” depths to meet today’s demands for increased insulation to boost U-factors in masonry walls. These corrosion-resistant channels are formed from hot-dipped galvanized steel; take THERMAFIBER® Z-Furring Blankets, rigid polystyrene, or urethane insulation; minimize effects of structural stresses and help prevent wicking of moisture to inside surfaces. Call your USG Representative, or write now for latest literature complete with updated U-value charts.

To most architects and engineers today, professional liability protection is a matter of course. 20 years ago it was a matter of luck.

We remember. That's why, back in 1955, we sat down with AIA, NSPE, and Continental Casualty Co., and came up with a breakthrough:

The first truly broad form liability coverage, for every qualified professional, in every state of the Union.

We've been right behind you ever since. With the first nationwide network of claims specialists. The first Joint Venture insurance. The first Equity Interest coverage. The first Construction Management protection. The only Post-Retirement policy. The most comprehensive Loss-Prevention service in the industry. The only coast-to-coast team of expert defense attorneys, with offices in nearby cities and towns across the country. And the leading carrier in the field — licensed in each and every state and territory.

It's a 20-year record of leadership and performance. A record built on trust. Because we've always considered your interest first. And through good times and bad, while other companies have come and gone, we've been here. Our professionals have always been protected.

So when you consider what's at stake — your good name, your practice and possibly your whole career — there's really only one question to ask: Why settle for anything less than the best?

Victor O.

Schinnerer & Company, Inc.

And you thought that
B.F. Goodrich
only made whitewalls.
we can make red walls, green walls, or gold walls. Barnboard walls. And grasscloth walls. Walls have a look of leather. Full rich vinyl textures of all kinds.

And the B.F.Goodrich name is your assurance they’re quality vinyl wallcoverings. The very we can manufacture.

Each pattern and design stands out because we’ve added a bit more to the textures. They’re rich. Deep.

And because our wallcoverings are made of lacquered backed vinyl, they’re strong. And tough too. The beauty never fades.

B.F.Goodrich vinyl textures can take a lot more wear and tear than paint can. And you won’t face the cost and hassle of regular repainting.

Think about it. And when it’s time to cover your walls, specify B.F.Goodrich.

Get a hold of our Koroseal® swatch book. Check Sweets for your nearest BFG distributor or call Sweets Buyline (800) 255-6880.

B.F.Goodrich. Our name says it’s the best.
The beauty of Alcoa Coilzak in parabolic luminaires is the beautiful way it controls light.

Parabolic luminaires are esthetically pleasing, in the design of the fixture and in the type of light they disperse. This is particularly important where people work, read or shop, where low visual brightness contributes to a comfortable atmosphere. The secret is precise light control, made possible because the reflective material in quality parabolic systems is Alcoa® Coilzak lighting sheet. Note that we said lighting sheet. In a properly designed luminaire, reflectivity is only part of the story. Controlled image clarity and reflective diffusion are just as important. Alcoa Coilzak sheet is an Alzak®-finished reflector material that meets precise reflectivity and gloss standards.

Operating costs of a parabolic lighting system can be low. Because of its efficient light distribution, a properly planned system may require fewer luminaires, resulting in low electrical loadings. Savings in cleaning maintenance are possible also. Parabolic luminaires do not require a lens and the unique design plus the static-free Coilzak louvers, resists soil and dust accumulation.

For more information on the many advantages of Coilzak lighting sheet in parabolic luminaires, write Aluminum Company of America, 310-C Alcoa Building, Pittsburgh, 15219, or see us in Sweets under 16.10a/AL.

*Registered Trademarks of Aluminum Company of America

1. One-piece constructed Coilzak reflector with accurately controlled parabolic shape.
2. Extruded aluminum trim.
3. Coilzak parabolic baffle assembly.

This full-recessed drinking fountain

Goes on Giving!

A drink of water now, when the building is new, and for years to come. Haws incorporates this unparalleled product reliability within a smoothly molded receptor of Polymarble. Suit your decorating fancy with Tan, or give some thought to Satin Gray, Yellow Mist, Cerulean Blue, Pistachio Green or White. With any Polymarble fountain you choose, there's luster that lasts, to resist bumps, abrasion, chalking; plus the cleanly swept appearance of recessed bubbler and flush-mounted push-button valve.

Polymarble drinking fountains, part of the Haws experience in reliability since 1909. For full product information and Polymarble Color Selector, contact your nearest Haws Representative or Haws Drinking Faucet Co., 1441 Fourth Street, Berkeley, CA 94710.

The Connecticut Connection.

Andersen joins character with convenience at a New England townhouse complex.

Joining the character of the traditional look with the convenience of the contemporary life was a primary objective of this project.

That's why Andersen® Perma-Shield® casement and Narroline® double-hung windows were chosen.

The inviting nature of the casements... the classic styling of the Narroline units... the charming angle bay and bow arrangements... all helped in establishing a warm, pleasant, traditional appearance.

But even more importantly, these Perma-Shield windows helped link the Connecticut townhouses to carefree living.

Because all Perma-Shield window surfaces exposed to the weather (except the Narroline sash) are protected by a rigid vinyl sheath.

A durable, long-lasting shield that provides convenience by virtually eliminating maintenance—it's designed not to rust, pit or corrode. Not to chip, flake, peel or blister. (The Narroline sash is safeguarded by a weather-resistant polyurea finish.)

And with double-pane insulating glass, these snug-fitting windows offer a major part of the fuel-saving benefits of single-glazing with storm windows, plus the convenience of no storm window cleaning.

Are you working on a project that'll bridge the look of yesterday with the life of today?

Bring it together with Perma-Shield casement and double-hung windows.

For more details, see your Andersen Dealer or Distributor. He's in the Yellow Pages under "Windows." Or write us direct—Andersen Corporation, Bayport, Minnesota 55008.

The beautiful way to save fuel™

The place: Knott's Berry Farm Airfield Eatery. The assignment: recreate a 1920’s hangar . . . and with it, all the fun and excitement of that most flamboyant of eras. For assistance with the restaurant’s spectacular barrel arch roof, architects called on Trus Joist engineering.

**Our advanced engineering technology accomplished easily what other systems couldn’t.** MICRO4LAM® chords were brought to a taut 35’ radius curvature through an arc of 90° in a 50’ span. Our lightweight, rapidly-installed wood-and-steel trusses are tough enough to handle the load, yet open enough to keep the old hangar aura.

Our technical representatives and engineers are experts and innovators in structural systems. We’ll back you up from computer design and layout assistance to delivery coordination and jobsite inspection. So whether you’re recreating the 20’s or planning for the 80’s, you can count on Trus Joist to make your place in history secure.

**Architect:** Ronald D. McMahon & Associates  
**Engineer:** Ruthoff & Englekirk  
**Contractor:** C and I Construction Co., Inc.

Specify Trus Joist.  
We’ve got our system down to a science.

Josep Lluis Sert and Joan Miró were both born in the Catalan city of Barcelona and knew each other when they were young. Barcelona has nurtured other contemporary artists including Picasso, Dali and Tapies; and indeed Catalonia is still the intellectual and artistic center of Spain. To acknowledge the long-time importance of his birthplace in the development of modern movements in art, the eighty-four-year-old Miró has donated a large collection of his paintings, sculpture, ceramics, prints and books to the city of Barcelona. Friends of the artist helped raise fifty per cent of the money to build a one million-dollar museum to display this collection and other contemporary art, and the city of Barcelona contributed the rest. And Sert donated his architectural services.

Because Sert’s eminently rational, conscious architecture is in powerful juxtaposition to the joyfully irrational subconscious effusions of his friend Miró, the building and its contents are excitingly dissonant. Sert has dramatized this fundamental esthetic polarization, and the effect is wonderful.—Mildred F. Schmertz
The use of the outdoor areas and roof terrace (below) for exhibitions more than doubles the available exhibit area. The landscape design makes good use of the existing features and planting of the old park in which the building is located (photos right). There are four courtyards, each of which has a different character and use: (a) central courtyard; (b) court with Miró sculpture (left) serving as a balcony to the city below and the mountains beyond; (c) the old walled garden with its cypress trees and cypress hedges; (d) the multi-use court space for happenings, directly linked to the Center for the Study of Contemporary Art and leading to the bar and auditorium. The first floor plan includes (1) entrance; (2) exhibit rooms; (3) room for temporary exhibits; (4) bookstore; (5) auditorium; (6) service.

Montjuich, a hill overlooking the old city of Barcelona to the north and the harbor to the south, is crowned by a castle built in 1640. Once wild, the hill is covered by a beautiful old park, much of which was designed by Forestier for the International Exhibition of 1929—the exhibition everyone remembers Mies van der Rohe's Barcelona Pavilion. The landscaped gardens include a number of important museums and palaces, an amusement park, restaurants and cafes. The hill is connected to the city below by winding drives or a funicular. The new Center for the Study of Contemporary Art/Joan Miró Foundation is superbly located below the castle, near the funicular and not too far from the Archaeological Museum, the Ethnological and Colonial Museum and the Palacio Nacional, visible in the photo at left, which houses the Museum of Fine Arts of Catalonia.

This magnificent site was selected by Miró and Sert from several offered to the Miró Found
by the City of Barcelona. It is an ideal location for the purposes of the Foundation as a place for the study and display of temporary art; a place to attract conferences, meetings and happenings; and a place where people can contemplate art, which at the same time offers facilities for a study of uniqueness.

The program for the complex was the result of a board of trustees appointed by Miró, and the late Joan Prats, a noted patron of arts and an early collector of his friend's work.

The Foundation Maeght in St. Paul de Vence, designed by Sert and built in 1964, served as a pattern for this programming. Sert and his Aimé Maeght with having taught him much about the programmatic, display and storage needs of museums for contemporary art. Sert points out that, like the Foundation Maeght, this new building is composed of fully proportioned spaces that have a variety of shapes, ceiling heights, sources of light, and degrees of openness.

The work and research spaces have been differentiated from the gallery space by inclusion in a three-story octagon. This shape strongly articulates the active as opposed to the contemplative side of the building. The octagon as a shape is very much a part of the architectural tradition of Catalonia—appearing often in the monasteries, churches, and fortresses of the Romanesque and Gothic periods and in the various Islamic monuments left by the Moors. While Sert's use of the octagon partakes directly of this grand tradition, the building also draws from the Mediterranean vernacular. It is white, vaulted, lit by clerestories, and oriented toward tiled patios and gardens. For all its subtle eclecticism, however, the building is not nostalgic. It is as intellectual and disciplined as Miró's work is deliberately not. The painter wisely chose as architect a fellow Catalan-become-cosmopolitan, whose work by
contrasting his own and whose knowledge of the culture of their birthplace is shared.

Sert sees the building as a series of volumes linked by a continuous, well designed circulation pattern. The way people move through these spaces is the key factor governing the plan. Circulation is strongly oriented in one direction so that people need not go through the same spaces unless they choose. The courtyards, gardens and roof terraces are part of this circulation pattern and are used for the display of sculpture, ceramics, mosaics, and for gatherings of people on special occasions. In everyday use they are quiet spaces, with benches permitting restful enjoyment of the gardens and art.

The plan has been devised so that some of the rooms are to be used principally for the display of the Miró collections. This display will be changing continuously because much of the work donated by the artist will be kept for storage or in traveling exhibits. The plan of
The roof terrace for sculpture display (above left) overlooks two courtyards including the central court and its ancient olive tree (bottom right and cover), the focal point of the plan, and a court (below) for which a Miró sculpture is the focal point. The city of Barcelona and its bordering mountains can be seen from these courts. The stairway (above) is part of the old gardens of Montjuich, the 700-foot-high hill overlooking the city. The principal entrance to the Miró Foundation building is across the road from this stair. The study center is to the right.

Visitor two main circuits. The first begins at the left of the entrance and interconnects the library rooms at the lower level with the gardens and courtyards. At the climax of this route is the two-story-high sculpture room, which contains ceramics, mosaics and tapestries. A ramp starting at the lower level of this room guides the visitor around the space and on to the second floor where he gains access to the library center. Here the rooms for the display of the library and study facilities are study rooms, administrative facilities, and a connecting stair leading to the library on the top floor. At the end of his route, the visitor goes down this stair into the study-center foyer adjacent to its 200-seat auditorium and from there back to the main entrance. A portion of this circuit through the courtyards, galleries and roof top terraces can be skipped off during the hours when only the study center is open. The other circuit takes the visitor to the right directly to the study center,
Included in the second floor plan at left are (1) sculpture room; (2) hallway; (3) print room; (4) balcony above first floor; (5) terrace with sculptures; (6) hallway at perimeter of exhibition space; (7) offices; (8) director's office; (9) restrooms; (10) print archive. The library and meeting room are on the third floor above the print archive and the auditorium is below on the first floor. The ramp (right) extends around all four sides of the sculpture room, allowing the work to be viewed from ever changing heights and angles. Miró has done several triptychs and the museum has two skylit alcoves to display them (below). These and other skylights (shown in the sections above) are similar to those used by Sert at the Foundation Maeght in Saint-Paul-de-Vence (RECORD, October 1974, pages 102-103).

which has its own courtyard and bar.

From both the exterior and interior, the building bears a marked resemblance to the Foundation Maeght at St. Paul de Vence, principally because of the prominent semicircular light scoops. Other Sert buildings have these scoops: Miró's studio in Mallorca designed in 1955 (RECORD, January 1957, pages 138-140) and the law library for Boston University (RECORD, May 1964, pages 161-170) are two of the most familiar. The scoops make maximum use of natural light, as Sert considers it to be of utmost importance for the display of paintings and sculpture. The light is diffused as it bounces off the curved surfaces. White draperies are used where necessary to diffuse the bright Mediterranean light as it enters through the frameless glass walls, which reveal the patios and gardens. Lighting has been built into the scoops to replace the daylight in the evenings or to augment it when necessary.

The structure of the building is of re
the sculpted concrete, used by Sert in the manner which is clearly his. If the scoops remind one of the Foundation Maeght, Miró's studio and Boston law library, the handling of the one-story, octagonal element is in the spirit of the Holyoke Center at Harvard (Record, May 1972, pages 131-146), the rest of his work at Boston University, and the buildings at Guelph University (Record, May 1972, pages 89-93). The two-story gallery structure, the ceilings of small barrel vaults, and the ribs of these vaults carry tracks for the lighting fixtures. The tops in the higher rooms are one-half barrel vaults. The nonglazed, non-bearing walls are brick faced on the exterior by precast panels in an exposed aggregate surface. In addition, outside of the building has another basic structure provided by the board-marked cast-in-place concrete.

A large basement is linked directly with a large elevator and stair and serves as storage of pictures, sculpture, films and books. The basement will permit considerable future expansion. Since the building is not devoted just to the work of Miró, Sert has given the building sufficient flexibility and potential for growth to display the art of our time and of the future in a variety of ways. It is planned that eventually half the space in the museum will be devoted to the work of young contemporary artists. As a symbolic harbinger of this, a gigantic sculpture by Chillida (not shown) has been placed in the front of the building, sharing this prominent space with a sculpture by Miró.

The auditorium (right) is in the basement of the three-story octagonal element shown in the section (below right). The mural on the panel extending over the speaker's rostrum is by Miró. Shown below is the short ramp leading up to the sculpture room.

The view of the sculpture room at the lower level (right) looks up toward the ramps. The box-like spaces under the ramp frame small sculptures. These boxes project on the exterior and form niches for sculpture displayed out of doors.
Yale University is preserving its great late-19th-century architecture by remodeling the Old Campus

Since the 1930s, Yale's Old Campus has been the home of the freshman class—an enviable group, fortunate in having overcome stiff competition to be admitted to one of the nation's leading universities. Generation after generation has moved into three splendid High-Victorian dormitories—Farnam (1869-70), Durfee (1871), and Lawrance (1885-86) all three designed by Russell Sturgis, Jr., and two fine examples of the English Collegiate style—Welch (1891) by Bruce Price and Vanderbilt Hall (1894) by Charles C. Haight.
Unused or partially wasted attic and basement space has been transformed into student living and bedroom suites

Except for the switch from gas to electric light, the periodic upgrading of plumbing and heating facilities, and general maintenance, these dormitories have been little altered since Farnam was begun. In recent years they have become desperately crowded. Double-decker bunks were crowded into small bedrooms originally designed for one. Up to eight students shared a single toilet, sink and shower in small awkward bathrooms in public hallways. To avoid using double-deckers, many students put their beds in the living rooms of what had grown from two-person to four-person suites, thus destroying what had heretofore been the shared communal space. For the students and their proud parents on moving-in day, only the elation generated by making it to Yale can have mitigated the thundering shock delivered by the first look at the tenement-like freshman suites.

Something had to be done. Several years ago a proposal for two new student residential colleges on nearby Whitney Avenue and Grove streets seemed to be the answer. John Hay Whitney of the class of '26 donated $1 million dollars for the proposed buildings planning began. Fortunately for the cause extending the life of these old dormitories, the colleges fell through. The University and New Haven Board of Aldermen could not agree on a tax financing plan for the proposed buildings and the Board refused to approve the construction. By the time this decision was over, the costs had become prohibitive. Furthermore, students at Yale and on other campuses were...
Welsh: The attic and fourth floor were combined with interior stairs to create large six- and seven-person duplex suites with double-height living rooms. On typical floors, four- and five-person suites were created with interior bathrooms by combining two former suites consisting of a living room each and bunk bed double rooms. One living room was converted to a double room, one living room remained, and all former bunk bed doubles were converted to single rooms.

Vanderbilt: The attic has been transformed into bedroom and living space. The basement, formerly used for storage and the old gravity heating and ventilating system, has been converted into suites by the removal of the large masonry heat boxes of the old system to gain space. The window sills were lowered and shallow grassed areaaways were made on the campus side. The living rooms on the courtyard side are lit by semi-circular top lit areaaways.
beginning to realize how much they loved old buildings and preferred them as places to live. There was little enthusiasm among Yale students for the new residential colleges scheme. As a result of these considerations, Yale's president, Kingman Brewster Jr. will have spent $7.3 million of Whitney's gift on Farnam, Lawrance, Welch, Vanderbilt, Durfee and McClellan including furniture, landscaping, management costs and all fees. The quarters of 1,000 students will be renovated at a cost of $7,000 per bed. (Costs of new construction in New Haven in 1975 were figured to be $13,-000 per bed.)

Brewster established a faculty-student committee headed by associate provost Jonathan Fenton to work with the two associated architectural firms: Edward L. Barnes, Architect, New York City and Herbert S. Newman Associates, New Haven. Every aspect of the renovation, from basic suite arrangements to the design of the storage units under each bed was carefully worked out among the Yale Office of Facilities Planning, the architects and the committee.

The goal of the renovation was to bring 120 beds and to reduce overcrowding; to bring the buildings up to the current life safety code; to renovate completely the heating, electric and plumbing systems; and to renovate all building finishes and the structure for long-term dormitory use.

The two architectural firms developed common design objectives for all the buildings to be renovated. First, they determined that the architectural character of each building w-
preserved as much as possible by retaining original materials, details and external appearance of the buildings—which when taken as a whole represent a unique period in late 19th century American architecture. Second, designers wished to provide a variety of room types and sizes. Third, they decided to provide two means of egress from each suite, accomplished without affecting the privacy of adjacent suites. Fourth, they concluded that the bathrooms should be provided within the suites rather than at public corridors and

The Lawrance typical floor suite corridors (Figure 1), and the basement corridor (Figure 2) are punctuated by a series of beautiful brick arches left intact by the architects. The arches have also been retained in the Farnam basement (Figure 6), and throughout the structure. The Farnam entrances (Figure 3) have new glass doors to accentuate the silhouettes of the beautiful pierced-stone transoms as seen from within, and to make the severely handsome character of the brick and tile stairwells visible from without. In the stairwells of Welch (Figure 4), new oak walls conceal emergency devices and utility closets while carrying the building's name and floor identification as an ornamental detail. The steeply pitched roofs in the Vanderbilt attic (Figure 5) make good space.
The policy of making the renovations invisible on the exteriors has enriched the interior suites

stairhalls. This makes the bathrooms secure from intruders, permits bathroom sundries to be left in the bathrooms, and encourages student maintenance of their own bathrooms.

As planning progressed it was decided that a six-person suite arrangement of four singles, one double, a living room and a private bath shared by all six was the optimum arrangement. This organization of space had to vary in response to the actual conditions existing in each of the old buildings. Wherever possible the architects converted the existing suites originally designed for two but now containing up to four persons into suites for six. This was done by converting alternate living rooms into double bedrooms, thus permitting the crowded small bedrooms to revert to single occupancy. Although on typical floors, the density increased slightly, a significant number of additional beds were gained by taking over the attics in Vanderbilt and Welch and the basements of Farnam, Lawrance, Welch and Vanderbilt as living quarters. The attics and basements were remodeled with great care to minimize the effect on the exteriors.

The renovation of the four halls shown began in the spring of 1976 and the building was made ready for occupancy last fall. Two additional halls including Durfee will be ready the fall of 1977. The freshmen are delighted with their new quarters, which now surpass spaciousness and esthetic quality most residential college living suites of upper class men including the cramped bedrooms of Eliot, Saarinen's Morse and Ezra Stiles College (1960-62). Traditionally, when a stud...
The Welch duplex living room (Figure 1) is part of a suite for 6 to 7 persons. To achieve this space, the attic and the fourth floor were combined. The double bedroom in the Welch duplex (Figure 2) has windows of the type that were used in all the attics renovated. Constructed of aluminum-clad wood and tempered bronze glass, they were designed for installation in a sloping roof surface with a minimum of disruption to the roof plane. The window has a reversing mechanism for exterior glass cleaning. The existing fenestration was kept intact in all buildings except for lowering basement sills or replacing sash, glazing, and trim where necessary. Farnam is the only building with all new window trim (Figures 4 and 5). The existing trim in Lawrence (Figure 3) was left as is. Fully furnished mock-up rooms containing the elements shown in the isometric were carefully analyzed.
The generous old dormitories had a lot of leftover space now brought to life.

leaves the Old Campus, he moves up to better quarters. If this is to continue, Yale will either have to upgrade many more student rooms, or put its seniors back on the Old Campus, which once, long ago, was their preserve.

—Mildred F. Schmertz

A typical basement living room in Vanderbilt (Figure 1) is lit by a top-lighted circular area away, which meets the light and ventilation requirements with a minimum of disruption to the landscape and architectural character of the Vanderbilt courtyard (page 95). The circular seating area (Figure 2) is in a basement apartment in Farnam. The second floor living room in Lawrance (Figure 3) extends into the turret, formerly occupied by an inadequate toilet facility. As already mentioned, the furnishing of the student bedrooms was done by the university according to mock-ups carefully studied by the architects, the students and the university management. The living rooms, however, have been exuberantly furnished by the suite occupants themselves, with the traditional reliance upon the New Haven flea markets.
Impressive new government center around a grand atrium space

An important new public building has been designed as the focal point of a developing civic center in Minneapolis. In a bold design approach, John Carl Warnecke & Associates provided a public space in the grand tradition of civic buildings that is also compatible with today's needs, a scheme that combines what the architects refer to as "informality within monumentality."
Completion of the Hennepin County Government Center in Minneapolis marks the beginning of a new civic center that will encompass an 18-block area when completed. The civic center's master plan (also designed by the Warnecke firm) was premised on the design of this building as the focal point of the area. While the plan establishes guidelines for future public and private development within the parameters (including the location, height and bulk of buildings, and the position of open spaces—all interconnected by pedestrian and aerial walkways), it does so with all aspects relating to the Center.

The Center's design concept was based on an exemplary planning process by both the architects and a facilities analysis and design firm, SUA, Inc. SUA began an extensive, detailed space utilization study in 1965; its recommendations subsequently stimulated the passage of 23 bills by the state legislature that reorganized the county government. One major recommendation which affected the design was the separation of county administration offices from the district and municipal courts. To express these two distinct services, a 24-story twin-tower design evolved (the east tower housing judicial facilities, the west tower housing offices).

The outstanding feature of the building, however, is a 350-foot-high atrium created between the towers, bordered dramatically with exposed steel diagonal bracing. It is a great indoor space, enjoyed by the public and the employees—fully appreciated as a controlled, year-round environment, not affected by the changeability and severity of the Midwest's weather. The atrium is flooded with light through a combination of glass end walls and a large skylight. At the roof line, enormous exposed steel tetrahedrons frame this skylight and the corridors of the top floor.

By siting the structure so the inner court aligns with the towers of the old Municipal Building across the street (designed by Long and Kees in 1906) and by using glass curtain walls on this axis, views from the atrium are opened up and primarily focused on the old building, signifying the relationship and continued coordination of services between the two structures. Compatibility of the two buildings is further enhanced by the use of carnelian red granite on the new building's fa-
cage complementing the older building's granite exterior walls.

A unique structural system solved the inherent engineering problems of the atrium concept (Record mid-August 1974, page 82). Diagonal wind-bracing was positioned on the interior walls facing the atrium rather than on the perimeter of the building, and exposed the full height of the court. The total space frame acts like a cage, stiffening the building's frame, minimizing building drift and allowing 85 per cent usable floor space in the towers. It accepts lateral loads (transmitted from the composite floors through diaphragm action) and distributes the stresses downward throughout the 180-foot building length. The cage is supported below the public service level by 30-inch-thick concrete shear walls, constructed on bedrock. The building spans a street using a conventional support system (rolled structural steel shapes, designed compositely, with a concrete topping slab).

Because the center spans a street, spaces were created for two large landscaped parks. Recycled water from the north plaza fountain flows one story below the street level, and can be seen from a large cafeteria. This level also connects the two government buildings and houses jury, computer, mail and printing facilities.

A total cost of $49.3 million for the building (not including $1.9 million for landscaping and site work) was achieved. This is a surprisingly low $34 per square foot, with a large part of the savings resulting from the structural ingenuity of the diagonal bracing, which required less steel and fewer complicated connections of members than in many more conventional systems.

Despite a noticeable difference between the interior tower facades bordering the court (only one side is glazed for acoustical reasons) there is no air conditioning imbalance throughout the 4.3 million cubic foot court space, for a wall set back beyond a corridor in the opposite tower performs an offsetting effect. Seven elevated walkways (spaced every third floor above the public service level) span the court, connecting the two towers. Eventually a series of elevated bridges will connect this building with others in the civic center.
The design of courtrooms (top and right plan, page 105) affords the most modern security measures while solving acoustical and lighting problems. Public access to courtrooms is only by a corridor on the atrium side, while judges’ chambers are located along the perimeter with access to the courtrooms by a separate inner corridor. Prisoner holding cells and auxiliary court personnel offices are also near the inner corridor. A Commissioners’ meeting room (above and right) provides an unusual design concept for public meetings. Seating is provided for only 90 persons inside a glass enclosed meeting room, with additional seating for 200 persons outside the enclosure, allowing limited direct public participation.
ANCHORS AWEIGH ON CHICAGO'S LATEST AMENITY

Last summer, Richard J. Daley, the late legendary mayor of Chicago, decided to drop by his favorite building. He had long been seeing to it that as many new buildings as possible got built, but his favorite one was altogether different. This was Navy Pier, built in 1916 to the design of an architect named Charles S. Frost, and now, 60 years later, being rebuilt to the design of the mayor's Bureau of Architecture, whose chief is Jerome R. Butler, Jr., the mayor's City Architect. Why would an abandoned pier, 3,040 feet long and 292 feet wide, have excited Richard J. Daley so much? Maybe he knew that its fun-handling facilities, as much as its freight-handling facilities, had excited many people over the years, and maybe, too, he thought that, turned into shipshape condition, it would be the best place for them to take in the skyscraper-studded skyline that his 21-year rule helped to create.
A

h, but the ragtime was resonant. It is almost as though Scott Joplin had
taken up architecture. But when Chi-
gago, in 1916, let out with “Municipal Pier
No. 2,” stretching three-fifths of a mile east-
ward into Lake Michigan, people recognized it
right away as the kind of place they could tap
their feet to. And as the Twenties roared, the
pier turned into the marathon mix of function
and mood that it was meant for, achieving nec-
cessity, amenity, and levity all at once.

Excursion boats, cargo ships, and lake
steamers moored alongside its parallel double-
decked sheds, each 100 feet wide and jumping
with stevedores, passengers, and freight. At its
outermost reach was a recreation area with
high arcades and extravagant esplanades.
Crowds attended art shows, plays, trade fairs,
picnics, and they danced inside a glittering,
cavernous 3,500-seat concert hall and audito-
rium, canopied with soaring metal-ribbed
arches. Hook, line, and sinker, Chicagoans fell
for the place. Even dust fell for it, as the lan-
terns atop the two 165-foot concert hall towers
glowed, the roof-garden band playing on.

It was called a modern Sans Souci, a place
without a care, and as long as they were in a
position to behave similarly, this relentlessly
nautical, slightly naughty pier gave Chica-
goans a round-the-clock mix of reasons for get-
ting together—and inexpensively.

Not that Chicagoans, or anyone else, are
without a care these days; but in 1974, Mayor
Richard J. Daley, full of Bicentennial fervor,
decided that a Sans Souci might be just the
thing for Chicagoans, and, as he had a habit of
doing, he called up his City Architect, Jerome
(Jerry) R. Butler, Jr., head of his Bureau of Ar-
chitecture, and said to find out what could be
done to shore up the old swinger.

Under Jerry Butler, who, unlike many city
architects, was encouraged to call up the
mayor about almost anything, the 100-person
Bureau has become one of the most design-

and quality-conscious public facilities agen-
cies in the country, a professional proficiency
that Daley’s successor, to be chosen in a special
election in June, should encourage.

The pier, the Bureau staff soon deter-
mained, hadn’t been in any shape for fun and
games for years. Because as the Twenties
whispered away, people had been in less of
a mood for them as well. Passenger traffic on
the Lake dwindled, what with the Depression,
and, besides, the auto replaced the steamer as
the way to go. Although the pier continued as
a recreational facility through the Thirties, the
music stopped for good in 1941. Renamed
Navy Pier, the place went to school as a train-
ning base, its spaces hastily subdivided for of-

fices and classrooms.

It went to school a second time, in 1946,
when the University of Illinois, hit by the GI
Bill influx, leased the pier, and, until 1965, it
jumped with undergraduates attending what
became known fondly as “Harvard on the
Rocks.” By this time, despite a flicker of freight
traffic and occasional trade shows, Navy Pier,
especially at the eastern end, with its domed
terminus, had become a haggard, almost hope-
less mess of partitions, awkward additions,
blocked-up windows, and diseveled terra

cotta detailing. Parts of the copper roof were
seen to blow off, and, by the time the Bureau
team, led by Jerry Butler, Joseph W. Casserly,
and Daniel G. Jones, showed up to see what
could be done to help, parts of the concrete
slab, laid over some 21,000 Oregon timber pil-

ings, had dropped into the water.

With city plans for a huge international
trade fair/lakefront festival in the works, and
with thousands of people expected in connec-
tion with these events and the Bicentennial
summer, the Bureau came back to Mayor
Daley, who had seen Navy Pier plans come
and go, with a plausible two-phase program.
The first phase, for which the City Council ap-
propriated $7.2 million (later supplemented by
over a million more), took care of the restora-
tion and adaptation of the worst-off buildings
at the end of the pier; work was accomplished,
from design to rededication, in just the twelve
months leading up to the Bicentennial. The
second phase, for which programming is being
finalized and marketing studies done, will,
when approved, transform the remaining
2,340 feet of the pier—the old freight and pas-

cenger sheds running west from the fixed-up
recreation buildings—into a full-fledged pleas-
ure dome, combining cultural, commercial,
and added recreational elements.

Coming to terms with the first phase, Jerry
Butler recalls, “The major design problem was
refraining from doing too much. We had to
purge the place of the physical alterations that
had accumulated over the years, and that had
all but obscured the original character of the
public recreational facilities. And we had to
determine the extent of basic, largely con-
cealed, structural deterioration, resulting from
60 hard freezes and those awful storms. The
technical and esthetic challenge was to match
the color, texture, craftsmanship, and orna-
tmentation of another era, while keeping an eye
on the costs, and to make room for a mix of
present-day recreational and cultural activities,
without resorting to slick shoe-in effects.”

Of the $8.2 million spent on the first
phase of work, 20 per cent will never be seen
by the pier’s adoring public. All that went into
basic structural repair. The steel-frame, brick-
clad structure had to be exposed and exam-
inied. A lot of the the steel, it was found, had
become dangerously weakened. The precari-
ous condition of the floor had to be corrected
by ripping up substantial portions of the con-
crete slab and replacing the piling caps. The
expansive outdoor esplanade had to be raised
two feet in some places, three feet in others.
Deteriorated masonry and terra cotta had to be
carefully removed, and new materials, even
more carefully selected for their matching
properties, put into place. The idea was to re-
turn the buildings to their essential shell, in
preparation for adapting the retrieved spaces
for new use, and return them, also, to their
essential integrity.

For example, the original cast iron win-
dow and door frames were fixed up as much
as possible, and, otherwise, these were re-
placed with steel frames of a compatible color.
Eighteen different brick panels were laid up to
determine the best masonry match. To replace
the color and texture of the original terra cotta

ARCHITECTURAL RECORD March 1977

108
molding, limestone, costing half as much as new terra cotta, was selected. A copper-coated stainless steel was chosen for the roof for the domed concert hall and auditorium.

Says Dan Jones, project manager, who practically lived on the site during construction, “You could almost feel the pier coming alive again. And as we cleaned it up, clearing out the clutter, the place seemed to embellish itself because of the things we were taking away, not because of what we were adding.”

The original skylights, for example, sealed over by successive users, were unsealed and, in some places, expanded, so now a lot of natural light filters in. The Shelter Building, as it was called, was initially a kind of open bridge, connecting the Terminal Building just west of it, with the rounded, domed concert hall at the end of the pier. The second level of this “bridge” was enclosed with glass, creating a beautiful 20-foot-high year-round “shelter,” while its ground level was opened to let the outdoor spaces and breezes flow underneath across the site.

In the case of the old concert hall and auditorium, steps were taken to improve acoustics and mechanicals, but, other than that, it is its good old self. One of the best interior spaces is the second-level promenade, which was retrieved by removing the window frames along the inner wall overlooking the hall, and by installing new windows around the outer wall. These arch-framed openings are arrayed all around the big building and the promenade performs as a balcony for both the hall and for surveying the lakefront scenery.

That scenery is not unlike being on a ship, and it is hardly steerage class. While the interior floors are finished with terrazzo, the outdoor esplanades, representing five of the pier’s 34 acres, have been paved with an exposed aggregate, laid down in a checkerboard-pattern, which is picked up, again, on the roof promenades where a subtle deletion was also made by removing the continuous masonry pediments and replacing them with simpler metal railings, thus enhancing the lakeside views and lightening of the top-heavy look of the structure. Pointing up the people- and play-oriented mood that Mayor Daley, week after week, was insisting on, trees, benches, and flags were supplied. There was even a carousel, the Mayor’s idea.

The festive mood he envisioned out here on the Lake is in hibernation these harsh winter months, but many possibilities are being pursued by the Bureau of Architecture for the second phase of the project so that it can be used all year. According to these projections, the upper level of the north and south sheds, which have been used as exhibition halls, would be renovated, mostly for exhibitions, and partly for tennis courts, which would be two levels in height. The lower level of the north shed would house assorted restaurants, shops, and other athletic facilities. Just north of this, between the pier and the low-lying Central Filtration Plant by C. F. Murphy & Associates, a marina has been proposed. The marginal amount of overseas shipping that has survived would be encouraged to continue and even expand, helping to restore the atmos-
From the Head House on the shore end of Navy Pier (near left) to the Terminal, Shelter Building, and Auditorium far out in the Lake (below), Navy Pier, rededicated last summer after years of deterioration, is a relentlessly nautical array of flexible interior spaces and dramatic outdoor esplanades. From the roof garden of the Shelter Building (far left), or from the newly paved and landscaped plazas, there are sweeping, well ventilated views of the skyline. The festive atmosphere (right), will be greatly amplified in the proposed second phase rehabilitation of the parallel sheds.
pheric as well as commercial benefits of having it around, and right in view. To the south of the pier, the existing Dime Pier (in the old days it cost that much to walk out onto it) would be converted for rod-and-reel fishing.

Studies have been made to show the feasibility of converting the big hall for professional theater and other sections of the north shed for educational use. Should an outfit like the Naval Reserve Armory or the Goodman School of Drama take space, as has been suggested, "Good Ship Lollipop" will never be the same again as all of the variations of the last 60 years are reincarnated in one spritely venue.

Construction plans are already underway for a solar space- and water-heating system, as the result of a grant from the Energy Research and Development Administration last October, and this will take care of over 30 per cent of the restored Terminal Building's needs. On top of the south shed, 8,500 square feet of solar panels will collect the heat, which will be passed into an exchanger, and then stored in a thermal tank full of circulating fluid. So even in the area of applied scientific research, the pier is proving that there is, after all, nothing old under the sun. The Bureau has also been going to considerable lengths from the standpoint of old technology to come up with a reproduction of the early street cars which used to careen through the complex from the lakefront out to the end.

It is this lakefront—the legacy of such "City Beautiful" advocates as Daniel Burnham and perhaps the most resplendent in the nation—which the reactivated Navy Pier is meant to enrich. Parks and abundant public facilities stretch eight miles to the south of the Loop area, and another eight to the north. The location of the pier, stretching out from the northern edge of the Loop, is crucial, because in its former, forlorn condition, it was an obvious dropped stitch in an otherwise continuous seam. As the second phase of the program unfolds, including the development of additional park land to the northwest of the pier, the lakefront will be truly complete. And a projected 1,225-car parking area to the southwest, slightly sunken and lavishly landscaped, will help alleviate the noxious presence of cars while, at the same time, making the pier more convenient for drivers. The 80-foot-wide space, running between the sheds, would also be converted for some parking (400 cars). Its east end, next to the Terminal Building, would be available for amusement facilities and fairs in the summer and for skating in the winter.

Looming across from its west-end Head House and entrance plaza is the curvilinear Lake Point Tower apartment house, by Schippan & Heinrich, which now inadvertently announces the pier, almost like a sign post, as one approaches the area from the city or whisks by on Lake Shore Drive. An interesting historical note is that the Tower's antecedent was Mies' unbuilt Glass Skyscraper Project, designed in Berlin in 1922—concurrent with the pier's first Golden Age. In an urbane composition, its brilliant descendant now bears witness to the pier's second Golden Age.

No so-called master plan ever called for such a relationship, which makes it all the
more worthy, because this kind of subtlety, linking the visual and symbolic increments of a city's experience, is not the kind of thing that master plans usually call for. So as the budgetary block-and-tackle for the pier's second phase is being hoisted into place, and while the ragtime of last summer's reunion with the dressed-up landmark is still ringing in everyone's ears, it can only be hoped that Chicago's new leadership will understand that the total retrieval of this one resource, with its potential for commercial and cultural vitality, is and will be helping to make the most of those resources that are already in place nearby. The only way to "make no little plans" (Burnham again) is to make connections between urban elements that were not particularly conceived to connect. Here was a lakefront park with a gap in it, a deteriorated pier creating the gap, a legacy of inlets on either side, and an isolated skyscraper craving company—all now brought into play. Now that is a master plan.

Navy Pier isn't completely out of mothballs yet. In fact, as part of the first-phase preparations for the Trade Fair exhibition spaces in the old freight sheds, a moth-balling substance was actually used to seal over the glass cracks and roof leaks—an exotic spray costing a nickel a square foot. But in addition to esthetic care and technical innovation, Jerry Butler's Bureau has worked a miracle of project management, a miracle, that is, in the context of most municipal construction procedures, which tend to grind exceedingly slow. Acting as general contractor, 22 separate contracts were awarded over a one-year period, which meant preparing 22 separate packages of contract documents. Skillful supervision and coordination of the work assured timely completion and, so it would seem, nothing was left out—right down to detailed, elaborate provisions for the handicapped and elderly.

When Richard J. Daley, almost obsessed by the place, dropped by last June to see how the work was coming, it was hard to pull him away from the 50 inner-city high school students whom he found, down on all fours, painting huge murals for the half-mile-long promenade along the north shed (these are on display at the Chicago Art Institute through March 31). The chords of camaraderie were proving irresistible then and, a month later, 100,000 people showed up to tap their feet again, moved by a counterpoint of fond memories from an earlier era. It was some event, including the visit of Norway's full-rigged Christian Radich (page 112), but with plenty of room and time for more activity, this building is full of potential. Anyone who is not for phase two probably hasn't been to Navy Pier. It's too late to slip the moorings on this landmark.—William Marlin

BRINGING IN THE BUSINESS

Images that attach themselves to individual pieces of commercial architecture are usually not particularly sweeping in their implications. As are almost never any spiritual overtones (as in religious buildings), there are few metaphors of hearth and home (as in houses), and the whole there are few striking symbols of public trust and civicization (as we sometimes expect in government buildings). Instead, the result of this goes on one thing, selling the product. Thus design problem for the architect—or at least the first part of the design problem—is equally simple: a good store is one which attracts people’s attention and answers for them the question of “Where can I buy this so-and-so?”

It makes “good” commercial architecture, we do business, and so bringing in the business is the high road access in commercial architecture. The architect who follows this will not necessarily achieve the status of fine artist (nor will he or she necessarily be denied it), and his works may not be soon canonized in the pages of architectural history books. Few stores ever have entries in the books anyway, after all, and so that is no great cause for concern. What is a cause of first concern is that the architecture of a store should work, it should attract attention, and it should draw in customers. All of the stores shown in this Building Types Study meet this criterion, and that is one of the reasons they have been included here.

Another reason—and a slightly unattractive one—is that all of the stores shown in the collection that follows are designed for suburban shopping centers. Until quite recently, if even then, architects felt slightly uncomfortable dealing with popular phenomena like suburbs and like the car, and so the suburban shopping center has seemed to represent the nemesis of bad taste and the nadir of architectural endeavor. Multaneously, the general public—sated, perhaps, with a 30-year elf-family romance—has just begun to show a rekindled interest in center city as a place to shop, and this interest is beginning to be channeled by what Business Week magazine called a “basic shift in retail strategies,” involving the renovation and sometimes the total replacement of “flagship” stores in major urban centers and the implementation there as well of traditional suburban shopping center design traditions. Architectural Record, too, in the December 1976, special issue, “The Home Towns Come Back,” has described the beginnings of a new wave of interest in medium-size towns as alternatives both for people and for the great cities.

All of these things are nonetheless still beginnings, and however much they will be welcomed by urbanistic architects and applauded by center city fans, they are movements that are still in their infancy. Near the greatest concentration of shopping facilities today is still in urban locations, and sites there—as just about everyone has already marked—are particularly fraught with peril when it comes to attracting the attention of drivers-by and would-be shoppers.

Attention-getting clamor

Suburban commercial sites generally have a manic proliferation of signs, gewgaws, and paraphernalia that work hard to hype up the battle for attention to the proportions of a major war. And it is a war somewhere between Vietnames and Pyrrhic in quality, with no clear winners and lots of losers.

How, then does the individual store (and that store’s architect) make an impression in the midst of all this clamor? Surely, in this context, the stealthiest course is to eschew the “more” and “bigger” treadmill and to pursue instead the course of “different.” All of the suburban stores shown in this collection try to be different from the standard suburban store, but they do it in two very different ways. The first one—Burdines Department Store in Tampa—sets out to be “nice.” The second group of stores—designed by the New York City consortium known as SITE (for “Sculpture in the Environment”)—sets out, broadly speaking, to be strange. Both approaches, though opposite, seem to work admirably, and both are very interesting to look at.

Nicer and nicer

Burdine’s of Florida, is a chain of department stores owned by Federal Stores, Inc. In the past five years, the company has commissioned the large Florida firm of Reynolds, Smith and Hills to design four new stores—in Clearwater, Tampa, Sarasota, and Plantation. The Tampa store, now completed and shown on the following pages, is a good example of the kind of refinement and stylistic upgrading that many suburban stores are now receiving, a phenomenon that comes directly from the client’s need to have a building that seems special and that achieves its specialness by a general elevation in over-all quality. “We wanted to come up with something better, something unusual, something exciting,” says the architect of the Tampa Burdines; “we wanted to respond to the needs of our client for something that would really stand out.”

The solution was to clad the two-story building in elegantly reflective stainless steel panels—panels that, since they are slanted away from the perpendicular, reflect the movement of cars and people on the ground and, at night, themselves become a shimmering announcement of the store to passers-by. The interiors of the new store are finished off with as much finesse, so that the over-all effect is one of simple, restrained, and modest stylistics.

Stranger and stranger

Different from this are the designs by SITE for Best Products Company’s showrooms. Best Products, the country’s largest catalog showroom merchandiser, sells more than 10,000 nationally advertised hard line items in eight states. In 1972 the company hired SITE to provide a startling revivification to its otherwise altogether standard showroom in Richmond (top photo, page 117). The public response was enormous, so SITE was again hired to do a large showroom in
Houston (bottom photo opposite), and they are now completing a third one in Sacramento and planning additional ones for Southern California. "We've always felt if we could get customers inside our door we could serve them well and have them come back," says Best president Andrew Lewis; "people either love the buildings or hate them, but either way they come in to enjoy them." James Wines, of SITE, adds, They're all screaming, 'How do you get people interested in shopping?' Whatever implications SITE's structures have, they will be public events."

Another (and higher?) "good"
A final note. Perhaps the most striking thing of all about SITE's stores for Best Products Company is a quality that they share with just about every piece of architecture that has any merit at all. It can be convincingly argued that, for all the extravagant variety of its manifestations, all good architecture has one thing in common: that it is at once familiar and unfamiliar, that it is vividly like something we already know about and, with an equal vividness, unlike anything else in the world.

Good architecture apparently doesn't thrive by being just one of these two things; it seems it has to be both, both like and unlike. Take the whole phenomenon of eclecticism, honored by millennia of practice and rejected by an early twentieth-century architectural aberration. Eclecticism is really about "like" and "unlike."

The Villa Rotunda in Vicenza is like Roman architecture (and virtue of that, like Greek), but it is also unlike it, being something we now know as Palladian. Stratford Hall in Virginia—by far the most remarkable eighteenth-century house in America—is like the splendid country houses of the rich in Great Britain, and in fact curious historians have unearthed a house in Ireland whose plan is meant to shoatford's "source." But anyone who has actually seen Stratford Hall recognizes instantly that it is peculiar to Virginia, to its site above the lower Potomac, and to the famous family who built it.

The architecture of Modernism, too, is by no means immune to the business of being like something (no matter what the Modernists actually said), and fine buildings by masters like Wright and Mies van der Rohe, Le Corbusier follow suit: like the prairie, like the Maya, like a machine, like a grain elevator, like a ship.

There is really no high mystery to the process of architecture being "like" and "unlike." It is as though we first need something comfortable and familiar (the "like") to win our confident attention, and then something strikingly different (the "unlike") to stimulate a flood of further interest—and to edify, please, surprise, shock, or even to dismay.

All this brings us to the perhaps unsettling conclusion that SITE's Best Products Company stores are—in much more than the functional mercenary sense—"good" architecture. They begin by being like
tenth-century classic, the familiar shop on the strip, and they need from there to turn that classic popular image (literally, in one on its ear.

The effect is astonishing, and it is also multi-dimensional. In one it is cataclysmic, an image that "responds to the unconscious byes of an America that is rediscovering pessimism," one French has wailed, "an America deceived by big business." True, the age of a big chunk falling out of the corner of a building, or of the thing jacked up on one side, or collapsing, or being altogether covered over by an asphalt parking lot in some final apocalyptic

aph of the automobile—all of this can be seen as pessimistic.

But it is also funny—and fun, and profitable, and very powerful. it's juxtaposition of the modestly familiar with the stunningly unfa-

ilar is like a bomb that arrives in a shoebox.

Herein, though, lies a slight problem, and it is the ironic petard of designers' own cleverness: where do you go from here? After open the shoebox the second time (if you've survived the first) we not particularly surprised to see the bomb there; it's no longer mi-

er. Similarly, after you've done just about everything you can in standard commercial warehouse building short of turning it up-
down, what's left to do? Nothing gets stale faster than a performer only one routine. So it will be interesting to see what SITE's next ser will be.—Gerald Allen
BURDINES DEPARTMENT STORE HOLDS UP A MIRROR TO PASSERS-BY
Aside from the large plinth-like structures at each of its corners, the facade of Burdines Department store is composed almost entirely of mirror-polished stainless steel panels that reflect the passing pedestrian and vehicular scene. The site for the department store is typical of suburban shopping centers, surrounded on three sides by vast expanses of parking lots. Landscaping is limited mainly to the periphery of the parking lots and to the area immediately around the store, so that there is very little to soften the visual impact of the undifferentiated asphalt surfaces. Accordingly, the unadorned facade with its large planar elements is appropriately at the scale of its immediate surroundings and makes a strong visual impact.
At nighttime, the facade of Burdines Department Store glows in the reflected light of passing cars; it is made of two-inch-thick, 30-inch-wide stainless steel and urethane foam panels.

"Most of us think of building materials as static things, although there are certain things always happening with light and shadows," say the architects of this particular facade, in their contribution to the building "has a capacity for changing its color and character—depending on the kind of clay and the kind of lighting, the color of the sky and the things that are happening around it."

Inside, the store has two levels of retail space (shown in the plans on the right) serviced by stage supply areas (shaded on the plans) on each level.
The upper sales floor of Burdines Department Store in Tampa is reached by a centrally located escalator space topped with skylights (photograph opposite). Also skylit are adjacent display cases, shown in photograph below.

AN "INDETERMINATE FACADE" FOR BEST PRODUCTS COMPANY, HOUSTON

SITE photos
"The concept" of this store, according to the designers, "is an architectural inversion of the standard merchandising warehouse located in a suburban shopping center. The brick veneer of the facade and side walls was arbitrarily extended beyond the logical edge of the roofline, resulting in the disconcerting appearance of a building arrested somewhere between construction and demolition."

SITE'S "NOTCH PROJECT" NOW UNDER CONSTRUCTION IN SACRAMENTO.
For the Sacramento Best Products store, SITE has designed a building that "calls for reductions as additions. A large, raw-edged notch will be removed from one corner of the brick structure which serves as the main entrance, and also as a monument."

SITE, Inc.'s "Tilt Project" for a small store in Southern California is the Best Products Company prototype, set in the middle of its requisite expanse of asphalt parking lot and surrounded by a sea of conventional houses and commercial buildings. But one corner of the building's outer shell is dramatically jacked up—like (unnerving) product of an earthquake.
"The concept," according to SITE, Inc., "is a multiple inversion of the combined ingredients of strip merchandising—parking lots, acres of automobiles, and shoebox warehouses—based on the theory that these eyesores, although condemned by purist designers, are not in themselves bad; it is simply negative attitudes toward them that prevent interesting solutions.

by Edwin Slipek
Best Products Company, Inc.

In the early 1970s, the president and executive vice president of Best Products Company, Inc., scouted the greater Houston area with the intention of expanding their catalog showroom operation there.

The area did not lack for handsome retail establishments. But there was little in the commercial architecture of the city to keep one's attention or expand one's interest.

"It was our first experience in Texas, and we were impressed that each company had a spiffier and showier building than the next," said Frances Lewis, executive vice president, "but after we had left Texas and returned to Virginia, our company's headquarters, we could not remember which company had built which structure. This was particularly true of our competition."

It was then that they decided that Houston might be the perfect location to make an immediate impact, establish identity, and have some fun by engaging SITE, Inc., of New York City to design the facade of the new building.

SITE's first Best work
SITE had its first crack at a Best Products Company building in 1972, when it had been hired to redesign the facade of a showroom in suburban Richmond.

The unassuming red brick showroom had been open for a number of years and had been quietly swallowed up by the suburban commercial strip around it.

"After the building had been built, we thought 'Good grief, this is the perfect ugly public space. Let's get SITE to do something with it,'" said Mrs. Lewis.

SITE's first proposal for transforming the dreary structure called for a "floating" brick roof which would have been constructed over transparent glass mullions. But in order to carry out the construction, business operations would have had to be shut down, and so the design was rejected.

The solution that was accepted and built, without losing a single day of business due to construction, included a "peeling" wall (page 117). The facade gives the appearance of brick facing rolling off the supporting masonry wall.

Three years after completion of the "peeling" facade—in November, 1975—Best Products opened its Houston showroom in the Al-
meda-Genoa shopping center (pages 124-
125). SITE’s solution here was to give the outer
walls a crumbling effect. The building immedi-
ately gained notoriety as well as acclaim.

Vending machine merchandising
Although the SITE-designed facades are
unique, the interiors of these showrooms are
no different from those of some 40 other more
conventional Best Products Company
showrooms located in eight states. Most Best
Products buildings contain some 64,000
square feet of floor space with roughly 70 per
cent devoted to warehousing and 30 per cent
to retailing. The warehouse occupies the entire
second floor and a portion of the ground level.

The design of the sales floor varies little
from showroom to showroom. The layout has
been devised over the years to provide Best
Products with what it considers the most ac-
cessible, efficient, and economical way to
move customers into the building and serve
them.

Best Products distributes over 2.5 million
catalogs annually. These include more than
10,000 nationally advertised items—hard
goods, primarily, like cameras, jewelry, house-
wares, appliances, stereos and other elec-
tronic equipment, toys, and sporting goods.
Catalog distribution is concentrated in house-
holds and businesses in communities where
Best Products showrooms are located. Thus
convenient and immediate pick-up by the con-
sumer is what makes the efficiency of the
showrooms more important than they would be
for a conventional mail-order retailer.

One sample of each product is displayed
on the sales floor. After examining the sample,
if a customer wishes to make a purchase, the
merchandise is sent down from the second-
floor warehouse—in the manner in which
candy bars are sold from vending machines.

But does SITE’s solution sell?
Have the unique SITE-designed buildings
helped Best Products’ sales? Yes, they have.
Andrew M. Lewis, Best Products president,
says: “Business increased significantly with
the completion of the Richmond SITE design. And
in Houston, sales exceeded our budgeted sales
estimate by 40 per cent.”

Lewis adds that he hopes the SITE-de-
signed Sacramento building, scheduled to
open in April of this year, will generate even
greater results.

But, according to Lewis, equally impor-
tant in the company’s decision to incorpo-
rate novel design in some of its buildings is the
hope that the structures are making a broader
statement and a contribution to urban design.
“We hope our buildings will stimulate citizens
to discuss the very nature of art and archi-
decture, function and form in buildings. Con-
cern for the environment—visual and other-
wise—is an increasingly important topic.
“We do not think it necessary that busi-
ness always portray itself as interested only in
profits, with no sense of humor,” he adds;
“business must be willing to experiment some-
times, and to take risks. We hope that these
buildings will help humanize those relation-
ships between business and the consumer.”

Best Products’ Sacramento store,
now under construction,
will be finished this spring.
What size solar heating system is economical for a house?

Donald Watson, AIA and Fred N. Broberg, P.E.

The practicality of solar heating for houses ends, first of all, upon climatic factors and anticipated cost of conventional fuels. The most favorable locations are cold, clear climates where the heating requirements are high where there is ample winter sunshine—the worse the weather, so if local fuel rates are high.

Some degree of solar heating is economically feasible in the colder northern climates. The most critical variable in determining how much solar heating the owner of a house can afford is the escalation of conventional fuel costs: the higher the rate, the more practical are the capacity solar-heating systems.

Climate, too, is an important variable. Cities like Pittsburgh and Denver are both near 40° latitude, they receive quite different amounts of sunshine because of differences in cloud cover, sky cleanness, and altitude. And Williston, the gas capital of Montana, is much farther north than Denver or Pittsburgh, and has much greater space-heating requirements. Its abundant winter sunshine makes it as viable a location for solar heating as Denver. Hartford is included as a representative New England city, with moderately high heating requirements, but only moderate winter sunshine availability.

In this article, the economics of six approaches to solar house heating are compared with the representative northern climates. For the economic evaluations, it was assumed that the additional costs of the solar systems were amortized over the life of a 20-year mortgage at 8% per cent interest, and that savings in conventional energy are averaged for the 20-year period and divided into monthly-saving increments. Average monthly paybacks in the first table, and in the graphs that follow, are determined by subtracting monthly amortization costs from the monthly energy savings.

Systems range from domestic hot water, to window heat recovery, to space heating.

**Alternative A: Solar Domestic Water Heating.** A small solar collector area (two or three collectors) can supply a major portion of the year-round requirement for domestic water heating. Solar domestic hot water equipment, now available from many manufacturers throughout the United States, imposes few if any restrictions on the building design.

**Alternative B: Window Heat Recovery.** An approach to solar heating that is often neglected is the utilization of heat gain from solar-oriented windows, Skylights, greenhouses and sun rooms. Window heat, of itself, has the effect of overheating the sunny side of a building while the colder side still calls for heat. Window heat can be recovered, however, and more evenly distributed by an air circulation system that removes heated air from windows, sun rooms and/or upper portions of the house and passes it through rock storage—in effect cooling the house when it is overheated during winter days and storing the heat for some nighttime carryover. Installation costs of windows are part of the normal house construction and rock storage can be built within typical foundations. Sun rooms or greenhouses

can gain solar heat without overheating the residence itself.

Alternative C: Auxiliary Solar Heating. Auxiliary solar heating, like window heat recovery, involves only a small investment for partial solar heating. As first suggested to the authors by Everett Barber, Jr., auxiliary solar heating is a system that uses the same components as a solar domestic water installation (Alternative A, above) adding only a few more solar panels to increase collection area, and a heating coil to pipe excess heat into the conventional space heating system. Other than increasing the size of domestic hot water storage slightly, no other heat storage or controls are involved, and thus installed cost and construction requirements are small. The control sequence used—whether to supply domestic hot water first with the excess to space heating, or the reverse—depends upon engineering decisions related to climate and comparative fuel cost. In this article, the former control sequence was assumed.

Alternative D: Auxiliary Solar Heating and Window Heat Recovery. This option combines previous Alternatives B and C. If a window heat recovery system did not have the rock-type heat storage component, then it would be redundant to combine it with the auxiliary space heating system since both would provide space heating on sunny days only. However with heat storage, the daytime heat recovered from the house can be carried over into nighttime hours.

Alternative E: Solar Space Heating with Relatively Small Collector Area. In this option, the collector area is held to less than 20 per cent of the heated floor area and thus imposes little constraint on architectural design while providing sufficient heat to a storage unit for partial carry-over. The solar panels also supply domestic hot water.

Alternative F: Large Capacity Solar Space Heating. This is the same as Alternative E, but with more collectors (approximately 40 per cent of the heated floor area). Of the solar alternatives compared, this option requires the largest construction cost but also contributes the largest percentage of solar heating.

In evaluating solar alternatives such as those just described, the architect and engineer must first of all assess their performance and their esthetic impact. But whether a particular approach is viable or not is determined by the projected energy-cost saving. Life-cycle costing is important to the economics of solar house-heating approaches; and, yes, it involves judgmental decisions about fuel cost increases that directly affect the relative economic merit of the various alternatives being evaluated.

High quality solar equipment was assumed in projecting system installation costs. The same building plan, a one-family 1200-sq-ft house, is used for the tables and graphs, with construction costs and present fuel costs assumed to be equal in all four locations. Housing is a good candidate for solar heating because of its steady demand for relatively low-temperature heating, including a year-round demand for domestic hot water, and generally detached or low-density construction which offers a large surface area exposed to the sun.

While cost and performance breakthroughs in solar technology can be anticipated, these are not considered in the estimates. The performance and costs of the solar equipment, and the installation costs used in the comparisons represent state-of-the-art estimates. The installation costs used are relatively high, compared to costs claimed by other sources, but the solar-system performance assumed in the calculations also represents high-quality solar equipment. Lower installation costs and lower system efficiencies appear to be directly related at this time.

The heating load of the house in the example is greatly reduced by following high-insulation standards, with the result that the total energy contribution of the solar heating system is smaller (see graph at bottom of page 133). The solar heating payback would look better than the results reported if a higher heat loss due to poorer insulation characteristics were assumed.

The cost effectiveness of improved insulation standards is so apparent, however, that a reasonable architect or engineer would obviously use saving techniques first, and then compare the heating alternatives. The intent of the comparisons is to show what the relative economic merit might be of different solar approaches. After everything had been done by proper construction and design methods to reduce fuel requirement.

The table at the top of page 134 summarizes the heating-load calculations of the four examples in the four locations. Design heat losses shown are in the range of per cent less than average, reflecting high-insulation standards and reduced infiltration, and the loss that good planning and construction achieves.

The table on page 131 shows the average monthly fuel cost savings, less finance charges, for each of the six alternatives for assumed annual fuel cost increases of 0, 8, 12, and 16 per cent. The negative numbers in the 0 per cent fuel escalation rate column show that in spite of not increase in cost, the solar investmen
The cases do not pay back within the 20-year mortgage period. But, a projection of 8 percent fuel escalation is the consensus of private and government forecasts.

Solar-cost systems may save more money if a climate is favorable and fuel expensive. Particular interest in the payback results is the fact that the order of merit of the six alternatives does not follow the relative order of initial cost. It varies considerably according to climate and assumed fuel cost escalation. For example, the large-capacity solarheating approach, Alternative F, is among the least economical of the six choices at the present time, even though it may rank highest in "environmental merit" by greatly reducing reliance on nonrenewable and polluting fuels. But if fuel escalation increases above 12 percent per year, the economic merit of Alternatives D and E is highest in nearly every case, not for Pittsburgh where local cloudiness makes a large investment in solar heating still inapplicable. And if escalation were to rise to

Heat loss for a 1200-sq-ft Denver house built following conventional insulation standards is plotted in solid curve Qr₁, and following high-insulation standards, in solid curve Qr₂. The comparative solar-heat contribution of a solar collector with an area equal to 20 per cent of the floor area is plotted in the dash-dot curve Qa₁, and equal to 40 per cent of the floor area, in curve Qa₂. Although solar energy contributes more heat proportionately to the house with conventional insulation, the investment, overall, is not as cost-effective.
Solar heating adds a cost that can be recovered from savings in fuel

The top table lists the geographic and weather characteristics of four northern cities, and itemizes the heat-load characteristics of a 1200-sq-ft, well-insulated house located in each city. DHL is the heat loss of the house at outdoor design temperature. Yearly heating loads are given for domestic hot water, for space heating, and for the two combined. The bottom table lists the areas of solar collectors (CA), sizes of domestic hot water tanks, the larger dhw tank used for auxiliary space heating, and window areas (WA) for the assumed example. Storage (STO) is required for space-heating alternatives (except alternative C) and for window heat recovery.

The costs listed are the dollars required to pay for the additional cost of the alternative systems over that of conventional domestic hot water and space heating systems. The monthly cost is the additional monthly mortgage payment for 20 years at a finance charge of 8½ per cent.

16 per cent, the largest-capacity system would yield the largest monthly payback. And though Alternatives A, B and C rank low when fuel escalation is above 8 per cent, the table on page 131 shows that when combined (Alternative D), and the escalation is between 8 and 12 per cent, this Alternative is the most economical option in all four of the climates. The top series of graphs on pages 132 and 133 shows the approximate crossover points of economic merit of various alternatives as a function of changing fuel escalation rates. The bottom series of graphs have the same data plotted in another format to show the optimum percentage of solar capacity for given installation and fuel costs.

The example is limited to a single, though typical, case—that of a house financed under conventional mortgage terms. The economics, however, look poorer if compared with standard house construction, in which case the paybacks would appear more favorable. Installation and financing costs also depend on individual circumstances. Many individuals are able to undertake a solar installation on different financial terms than used in the example through low-interest building loans. Tax incentives are being considered on the state and Federal level that may further change current economics in favor of solar heating. System cost breakthroughs or performance improvements may result in more cost effective solar installations. Finally, the calculation methods used are monthly averages and result in only general results. Nonetheless, the relative order or economic merit of the various alternatives shown in the example would not change.

The study takes a moderate, if not overly conservative, view of solar installation and fuel costs in order to represent the typical case for solar heating with the options that it presents today. The results, in fact, suggest that—in the almost certain event that fuel costs will increase—some sort of solar heating is justified in any northern climate. If only solar domestic water heating and auxiliary space heating systems were to find the place in the residential market, the increase in production of solar equipment would make possible substantial economics of scale which would lead to lower costs for the larger capacity systems. Even now, a middle-range solution might be adopted—an incremental approach to solar heating in which a building is constructed with only a small solar installation at first, such as Alternates A through D, with provisions made in the design for adding more capacity in the future, as the economic variables change in favor of increased solar heating. Other factors that could help lower installation costs include "one-contract" supply, installation and servicing; solar building and equipment packaging; and various subsidized economic incentives. In any case, the need is obvious for close coordination between architect, engineer, manufacturer and builder to ensure that a solar installation is appropriate for a building in terms of climate, heat requirement and financing.

Donald Watson, AIA, of Guilford, Connecticut has done his practice largely to energy-conserving design since he completed the Westbrook Solar House, one of the first in New England to be built on the private market. He has since been involved in over 80 housing design using solar energy, including projects for ERDA and HUD. This article, copyright © Donald Watson, is based upon a chapter from a new book, Designing and Building a Solar House, published by Garden Way Publishing, Charlotte, Vermont. Fred N. Broberg, P.E., is an engineer with Hill and Rigan Consulting Engineers in New Haven, Connecticut.

Keep your cool with new Duraflake FR.

Relax...now there's a fire-rated particleboard that meets the most demanding building codes. New Duraflake FR is approved by Underwriters' Laboratories and meets all existing requirements for minimum flame spread, fuel and smoke contribution. Duraflake FR is the only graduated-layered particleboard to have a Class I Uniform Building Code rating from the International Conference of Building Officials.

Specify Duraflake FR with confidence for offices, hospitals, government buildings and other commercial structures. It's a superior substrate that can be drilled, routed, bull-nosed, beveled and specially shaped and cut, the same as regular Duraflake. And FR is also designed for the easy application of a variety of laminates and veneers for furniture or fixture design versatility.

For more information on how new Duraflake FR can solve the stringent new building code requirements, contact your local distributor or call Bob Clark at 503-928-3341.

Duraflake®
A Product of:
Willamette Industries, Inc.
P.O. Box 428
Albany, Oregon 97321

Duraflake FR is a product of the forests...America's completely renewable industrial raw material resource.

Talk To Us For Total Signage Systems

We found another way to add to our total signage service. We’ve always done our best to offer you the very best in signage. Signage that’s integrated into the building plan as a subsystem and coordinated to maximize building efficiency. Signage that’s compatible enough to enhance and blend with the building’s esthetics and yet remain functional.

Working with you, our Architectural Division can develop the entire signage system, fabricate it, install it, whatever it takes. Interior or exterior. And, we’ll take full responsibility for the finished product.

Now, how have we added to that kind of service? With a toll-free phone number. We do a great deal of business with you by telephone, so we decided that the one thing we could do to improve our total signage service was to make it easier for you to talk to us. All you have to do is pick up the phone and talk to us. Toll-free: 800/245-6574 (Pennsylvania calls: 412/344-4200). And you should have no trouble getting through. So talk to us. For whatever you need in signage systems—interior or exterior.
Paragon is proud to introduce the PassWall® system, embodying the latest in swimming pool technology.

PassWall® is an unsurpassed, complete system comprising an automatic, recirculating overflow combined with a stainless steel buttress. Backed up by steel buttresses, it is a structurally stable pool wall containing a complete, pipe-hydraulic system - eliminating all metal piping.

PassWall® is suitable for installation in any climate! It will not crack, bulge, or leak. Fabricated entirely of 12-gauge, polished stainless steel, it requires neither coating for section nor any annual maintenance other than wiping. It is shop fabricated and delivered to the job site in sections. Erection and installation are by factory-trained crews. Installation is completed quickly and accurately.

A recirculating overflow gutter is preferred system for competitive pools. (It is a requirement for pools in which national meets are to be held.) Absorption of turbulence by the gutter makes such pools quieter and allows faster swimming times. And our recirculation duct removed from the gutter - an exclusive feature - offers greater surge storage capacity than all other systems.

PassWall® is an economical system, offering the latest in pool design. You can now obtain all components for your pool from a single source, with a single responsibility pool wall with recirculating flow gutter, a superior line of equipment, complete filtration systems, chlorination and mechanical equipment, moveable bulkheads.

We've been manufacturing utility equipment for institutional and commercial pools for the past twenty years. When you specify Paragon, you'll be getting quality and reliability from a firm dedicated to excellence in design and manufacturing.

For further information, see us in the Architectural File, or write Paragon Inc., People Who Care, Paulding Street, Hasbrouck Heights, New Jersey 07604. We maintain area representatives who offer advice or assistance are located throughout the country.

FROM PARAGON: 20 YEARS OF MANUFACTURING THE BEST IN SWIMMING POOL EQUIPMENT.
Introducing the CLEANLINE® Sprinkler. A beautiful way to help save lives.

Now there's a new way to design in fire protection for life safety in modern high rise and other buildings without intruding upon design aesthetics. Grinnell's new CLEANLINE® Recessed sprinkler is so unobtrusive, so trim and compact, once it's installed you'll hardly know it's there.

But don't let CLEANLINE's quiet good looks fool you. Beneath that attractive closure you'll find one of the most reliable sprinkler heads in the industry. When room temperature reaches a predetermined level, the attractive closure falls away, exposing the fast-response Duraspeed sprinkler. As a second predetermined temperature is reached, the sprinkler activates, distributing a uniform water spray to put down a fire.

The standard finishes available are satin chrome and white. CLEANLINE Sprinklers are also offered in a variety of finishes to match any decor. All metallic finishes are UL-listed.

There's a lot more to tell about CLEANLINE. For more information and complete specifications, call your nearest Grinnell district office listed in the Yellow Pages, or write Grinnell Fire Protection Systems Company, Inc., 10 Dorrance Street, Providence, Rhode Island 02903.

Screen-printed carpet has commercial applications

"Rectangle" is one of four geometric designs in the company's "Watch-tower" commercial carpet line recommended for offices, stores and schools. Sixteen colorations are available. Wear and soil-hiding capabilities of the continuous filament nylon fiber combine with built-in static control. The 1/4-in. gauge carpet meets requirements of HUD-FHA UM44C for Type I, III, Class 1 installations. • Armstrong Cork Co., Lancaster, Pa.

Circle 301 on inquiry card

Printed fabrics are scaled for large windows

From Germany, contract fabrics designed by Gode de Boor are scaled for large windows. "Zodiac," 50-in. wide and 100 cotton, places broad diamonds or herringbone patterns with a precision rotation so that the natural folds of the fabric emphasize first one, then the other of the positive patterns. "Malva" (not shown), a 52-in.-wide polyester and cotton semi-sheer, is offered in pale monotones. Upholstery and wallcovering fabrics are also available in this line. • Souvenir Fabrics Corp., New York City.

Circle 300 on inquiry card

Red contract carpet designs

"Cross Bars," two of its designs by Jack Larsen for the Gulistan Collection, provide a contrast to the large expanses. The two shown can be used end to end without a seam side by side. Made of 100 percent nylon fiber with ribbed characteristics, all yarns come in three colors—Sapphire, Russet and Garnet. They are made in 10 ft. widths. • J.P. Stevens & Co., New York City.

Circle 302 on inquiry card

Gray is the keynote color of this 1977 fabric collection

Leathers, fabrics and carpeting in gray predominate in this group. Shown is "Saville Row," a hard finished upholstery fabric in wool and cotton. The affinity between the company's other new wool upholstery fabrics and carpets is often the loosely twisted heather-spun natural yarns used in both. Leather in the collection is very thick, heavy weight and—in the case of "Rhino"—shrink 25 per cent to exaggerate the wrinkles and natural folds of the skin. Colors range from ivory to russet to gray. The company has introduced wall fabrics in 100-in. widths to minimize seaming: sandy textures, heavy quilting and linen weaves. • Jack Lenor Larsen Inc., New York City.

Holophane lenses.

We make over 30 so you’ll have the right one for any lighting situation.

There are no pat answers when it comes to lighting. Each project has its own set of requirements. That’s why Holophane® offers you more than 30 different lenses.

We offer the right lens for classroom lighting, store lighting, low glare lighting, wall lighting and dozens of other specific applications.

Every injection-molded clear acrylic Holophane lens delivers tailored light distribution and high efficiency for energy-conscious installations. All wrapped up in a very attractive package.

Learn more about energy-efficient lighting solutions from your local Holophane representative, consult Sweet’s or write: Johns-Manville Sales Corp., Holophane Div., Dept. AR-3 Ken-Caryl Ranch, Denver, Colorado 80217.

Only a 100% THERMAFIBER®
fire safety system is 2000° sure!

THERMAFIBER Mineral
Fireproofing for columns and
beams goes on clean, fast, and dry.
Contains no asbestos.
Cleanup is minor.
Damage is easily repaired.
No temporary heating
during installation.

THERMAFIBER Safety
Insulation protects at the
intersection of floor slab and
curtain wall while
THERMAFIBER Curtain
Wall Insulation backs spandrel panel
assemblies.

It doesn’t take a disaster movie to call attention to
the life-or-death importance of fire-stopping. Or to
remind you of the energy-saving values that a fire
safety system contributes. But only one material
satisfies both fireproofing and thermal values effi-
ciently. That material is THERMAFIBER mineral
fiber. When subjected to the ASTM E119 Time-
Temperature Curve, THERMAFIBER did not melt
or disintegrate. All other materials tested disinte-
grated in from 2 to 14 minutes at temperatures from
550°F to 1375°F. Thus, to get THERMAFIBER pro-
tection, you cannot mix other materials in the sys-
tem. Only an all THERMAFIBER system provides
such performance. For detailed information and
research figures, write to us at 101 S. Wacker
Drive, Chicago, Ill. 60606, Dept. AR-37

UNITED STATES GYPSUM
BUILDING AMERICA
ELECTRIC-EYE FAUCET / Using a photo-sensitive beam to regulate water flow, Aquatron 12-volt DC solid-state sink controllers let water flow when hands interrupt the beam; water stops automatically when hands are removed from the beam. The unit can be included in new sink installations or used to convert existing units. Aquatron features preset water temperature and adjustable pressure regulation when used in conjunction with a hot/cold mixing valve; the electric eye is not affected by sunlight or room lights. The device fits any sink, and is said to be easy to install and economical to operate. Suggested applications include public rest rooms, restaurants, health care facilities, etc. • Qualco, Los Altos, Calif.

WOOD INSULATING WINDOWS / Designed for cold weather area use in multiple-housing construction, these Perma-Shield window units feature removable storm panels installed over double-pane insulating glass. The panels are said to improve insulation effectiveness more than 35 per cent over double-pane glazing alone. Windows are constructed with a rigid vinyl sheath over preservative-treated wood core and frame; weatherstripping is factory-applied. These triple-glazed units are available in Perma-Shield casement, awning, and double-hung windows, as well as some primed wood units. • Anderson Corp., Bayport, Minn.

Circle 307 on inquiry card

more products on page 145

TRACT OFFICES / The self-supporting component of the "Advent III System" may be arranged to freestanding office environments with minimal of mechanical connectors. Work stations need be disassembled to suit changing storage requirements; storage modules slide out and are easily added. Details of the office line, designed by Harvey Prober and Charles C. Keane, include rounded corners on all units; built-in planters; invisible fasteners and connector tracks; and task and ambient lighting fixtures by Lightolier. • Harvey Prober Fall River, Mass.

Circle 304 on inquiry card

MOUNTED PANELS / Permanent track, ceiling-mounted in a modular grid pattern, holds individual "Divisflex 301" panels, which can be arranged to form partial space barriers or complete walls. A "puck" suspension system permits panels to rotate turns, including right angles, in the track or out special adapters or switches. Seals at both top and bottom of each panel complete the closure from floor to ceiling, and act to reduce noise transmission. The panels are said to move easily, and can be rearranged without custodial help. Panels may be faced in textured vinyl, chalkboard, and sound-absorbing carpet. • Modernfold, New Castle, Ind.

Circle 305 on inquiry card

PRINTED/BLUEPRINTER / The "Econojet" copier is said to combine a small per-copy cost with high quality printing and developing. Copier produces 9- by 60- by 12 ¾-in., and can be used either on a desk-top or wall-mounted. The unit has a maximum speed of 9 ft per minute, and a printing width in excess of 42-in. by any length. "Econojet" centers meet all OSHA standards. • Teledyne Roteco, Stirling, N.J.

MORE IS LESS.

Get the extra protection of a fluoropolymer coating at significantly lower cost. With DURANAR® 200 coatings.

It's as easy as PPG. More protection at less cost — that's what you get with DURANAR 200 coatings. And that's what you'll find on this Montana power plant — DURANAR 200 coatings on siding and roofing panels of pre-coated Reynolds Aluminum.

The more-for-less secret is twofold:

First, DURANAR 200 coatings are based on KYNAR® resin to give you long-life fluoropolymer protection. You know how tough that is.

Second, PPG's patented combination of resins (U.S. Patent #3449466) gives you that fluoropolymer protection at a cost significantly lower than other fluoropolymer coatings.

And exactly what does a DURANAR 200 coating give you? It gives you a surface that's virtually maintenance-free, with beauty, durability, and color integrity that last for years. It's extremely flexible, extremely color-fast, extremely resistant to UV erosion. It's a two-coat system that can be applied to aluminum and galvanized steel, available in a wide range of colors in flat and semi-gloss finishes. And its color compatibility is excellent even with long-span and adjacent surfaces.

For all the details, write to Tom Keeling, Market Manager, Coil Coatings, PPG Industries, Inc., Pittsburgh Drive, Delaware, Ohio 43015. Or call him at (614) 363-9610. More is less with DURANAR 200 coatings. So get yourself more. For less.

Introducing...
Specialized technology in doors for engineered environments

- Pressure
- Temperature
- Blast Load
- Atmosphere
- Noise
- Chemical Reaction

Jamison can help you... now.
We can't guess what kinds of unusual door problems you're already into, or will be facing in the near future.

But we can say that more and more architects, designers, contractors, and owners are asking us to engineer and build specialized doors for specialized applications.

High intensity sound isolation, for example. And virology laboratory atmospheric security... protection from Arctic temperatures, searing heat and flood threats... controlled recreational environments... and many more.

Jamison has 70 years’ experience in dealing with the complexities of door technology... from cold storage to blast load.

We understand door construction, gasketing, sealing, insulation, hardware, cladding materials, and power operation. We know how to put them all together to meet a wide range of critical requirements.

You should have two informative new booklets describing our capabilities. Ask for them today... send our coupon or use the reader service card.

☐ Please rush me copies of Jamison's new literature on specialized door technology.
☐ Please have engineering representative contact me.

SPACESAVER SAVES SPACE

• TURN WASTED AISLES INTO USABLE SPACE
• SAVE 50% OF PRESENT SPACE OR ADD 80% CAPACITY IN THE SAME SPACE

Space for storing 240,000 X-ray procedures is provided in this hospital installation.

Long expanse of face panels offers excellent design possibilities. Wide variety of materials and colors available.

Where special security is required, system may be designed to roll together and lock when not in use.

PRODUCT REPORTS continued from page 143

About the only way to pick the new Emhart High Security Locking System is to select it.

When you specify a lockset incorporating the new Emhart Security Locking System, you have the key to positive building protection in your pocket. The odds against a would-be intruder beating the system are astronomical!

It's designed so that angular cross-cuts in the key bit rotate multi-section tumbler pins a precise number of degrees. This line-up T-slots in their upper ends mating projections in their upper sections to activate the cylinder. Considering the possible combinations of angles of rotation in the 6-pin cylinder, it's virtually impossible to operate without the key.

Russwin will custom build high security package to your needs with a fine quality lock and the Emhart High Security Locking System. Emhart System keys can also operate other selected Russwin locks, permitting the use of conventional locksets for normal security plus Emhart System locks in critical areas, all operated with one key. The System's cylinders may also be imposed on new or qualified locking systems.

Write to Russwin for complete details on the high security system with more angles than any burglar UL listed *Patent applied for

WICKER CONTRACT FURNITURE / The 84-in. sofa and 60-in. love seat pictured are part of the "Gallery Wicker II" collection of furniture for commercial and residential use. Also included in the line are armless chairs, ottomans, and a corner seating unit. The pieces have double-walled woven wicker frames mounted on recessed hardwood stretcher bases; Dacron-filled seat and back cushions are removable. Designed by John Wisner, the "Gallery Wicker II" line is available in several natural brown tones, and an assortment of bright lacquer finishes. • Ficks Reed Co., Cincinnati, Ohio.

Circle 315 on inquiry card

WALLS PANELS / "Panelcarve 1400 Series" features a geometric design theme displaying a variety of shadow effects on carved wood. The 1-in.-thick panels are available in 9 by 36-in., 9 by 48-in., and 9 by 96-in. sizes; a tongue-and-groove edge detail is said to permit easy assembly without surface nailing. Wall panels are all-heart vertical grain redwood, in several finishes. The "1400 Series" may also be ordered in Honduras mahogany, oak and other hardwoods. • Forms and Surfaces, Santa Barbara, Calif.

When you need hundreds of windows on a very tight schedule, start by specifying a very good window.

The bigger the project, the more you need to be sure of the windows. We've furnished windows like these Casemasters for projects requiring several thousand units. The Casemaster is beautiful, rugged, easy to operate, and tight. Those are some of the reasons they get specified. Another is that Marvin can deliver big numbers of windows on a tight schedule, including prefinished units set up and ready to go into the opening. Write for complete information on these and other fine Marvin units. Marvin Windows, Warroad, MN 56763. Phone: 218-386-1430.
PRODUCT REPORTS continued from page 146

VERTICAL LIFTERS / Electric-powered vertical lifting platforms do not need a pit for either portable or stationary installation. The freestanding lifters are constructed in sections, and can be quickly installed in existing buildings, according to the manufacturer. Capacities and lift heights range up to 50,000 lbs and 60 ft. Units are powered by electric hydraulic or cable drive; either power option can be mounted inside the framework, or at a remote location. Platforms are supplied with fixed or removable pipe rails, hinged or upsliding gates; side thrust rollers compensate for uneven loading of the platform. Suggested applications include freight handling, dock loaders and levelers, mezzanine service, etc. • Giant Lift Equipment Mfg. Co., Everett, Mass.

Circle 317 on inquiry card

WOODGRAIN LAMINATE / “Jacobian” is a parquet pattern of medium and dark-toned woodgrain “blocks,” available in both general purpose “H-5” and postforming “HHP-5” grade high-pressure plastic laminates. The laminate surface is suitable for a variety of residential and contract applications, including furniture, cabinets, doors and commercial fixtures. • Exxon Chemical Co. U.S.A., Odenton, Md.

Circle 318 on inquiry card

DIAZOPRINTER / Model “12FL” fluorescent, table-top diazoprinter features a negative-pressure developer tank for ventilating operation, and provides full domestic and international size capability with a 4½-in. printing width. Synchronized printing and developing is said to ensure processing of long prints without damage; solid-state controls provide repeatable speed settings of up to 15 ft per min. • GAF Corp., Reprographic Products, New York City.

Circle 319 on inquiry card

IS GAGE ENOUGH?

When you specify 16 gage material for a light gage load-bearing steel stud, you might assume that you'll get the same stud—no matter who you specify as your supplier. And if gage were the only consideration, you could be right.

But it isn't. You know that the yield strength of the steel is just as important. For example, members of the Metal Lath/Steel Framing Association form 16 gage and heavier members from high strength steel with a minimum yield point of at least 50 ksi. Not commercial quality steel that looks the same but won't carry the load.

Is gage enough? Be sure. Write for a copy of our Light Gage Steel Framing Specifications.

FULLSPACE...
the file with the movable aisle!

If you tried to provide your clients with this much storage or file space using ordinary files or shelves, you'd need 6 aisles and up to 4 times the floor space. FULLSPACE does it with just one aisle that opens where it's needed. Furthermore, when the aisle is opened, all the space on both sides is exposed, greatly reducing access time.

But there's more to FULLSPACE than space-saving and efficiency. High-quality finishes in handsome wood grains or colored laminates create handsome furniture that complements any decor.

Trouble-free electric HAND DRYERS That can't burn out

Surface Mounted
- No electric coils
- Maintenance free—only 3 moving parts
- High velocity air flow—dries face and hands in seconds

Vandal-proof cast aluminum
- Available for 120 or 220 VAC—no costly rewiring
- 3-year guarantee

Fastaire's® exclusive heat-by-compression jet-air principle eliminates heating coils, delivers high-velocity air flow up to 120°F. Meets federal agency specifications. Remote power units mount anywhere...behind partition...above the ceiling. Eliminates malicious damage, only push-button nozzle exposed. Fastaire's® models double as locker room hairdryers, too. Write for details: Humphrey, Inc., Dept. AR377, 2805 Canon St., San Diego, CA 92106. Telephone (714) 223-1654.

Just like no hinge at all

The hinge that hides

Some hinges are decorative. Some are functional. But only one hinge is invisible.

So when the best hinge would be no hinge at all, specify Soess. Choose from 18 models and four finishes. All models open 180° and disappear when closed. Complete specifications are in Sweet's. Or, write to Soss Mfg. Co., Div. Soss Consolidated Inc., P.O. Box 8200, Detroit, Mi. 48213.

LIGHTING KIOSK / Constructed of molded reinforced fiberglass, these freestanding units can be used to provide indoor or outdoor lighting in malls, parks, etc., and to display advertising. Other models, with doors and windows, may be used as self-contained selling centers or information booths. Kiosks are available in heights of from 5- to 10-ft, and diameters of 2- to 6-ft; over a dozen colors are offered for both top and bottom sections. Individual units are constructed from two parts: internal flanges on the top piece fit into the base for nut-to-bolt assembly. Completed kiosks are said to withstand wind loads of 100 mph.

* Visual Products Co., Melville, N.Y.

Circle 322 on inquiry card

PUSH BAR EXIT / This mortise exit device can be readily adapted to many narrow stile glass doors and metal frames, according to the manufacturers of the "8400 Series" dead latch push bar. The bar itself is 2.5-in.-wide by 30-, 36-, 42-, or 48-in.-long. Non-standard door sizes can be accommodated by shortening the next larger bar. The latchbolt is operated by a 1-inch straight travel, rather than a downward arc; normal unloaded release pressure required is 8 lbs. Standard finishes are satin aluminum, and bronze or black anodize.

Circle 323 on inquiry card

WASHROOM PARTITIONS / Low maintenance costs are claimed for these prefabricated crystalline marble interior partitions for washrooms, shower stalls or dressing rooms. Mablebalt partitions resist moisture, odors and stains; compartments include chrome-plated brass hardware and are available with either red oak or birch veneer doors. Units designed for the handicapped feature out-swinging doors and grab bars on each side partition.

Circle 324 on inquiry card

UNIT HEATERS / These wall-mounted forced-air unit heaters may be ordered in capacities of 2000 to 5000 watts; heating elements are all-steel finned sheath type. The front grille is designed to withstand heavy impact abuse and vandalism; a "Zero Voltage Reset" thermal cut-out provides protection if normal operating temperatures are exceeded. The "3420" and "3450" series heaters offer several factory-installed control systems, including hydraulic-type thermostats; relays for remote pilot duty control or time clock night set-back programs; and built-in circuit breakers for multiple heater hook-up to feeder and feeder taps.

* Markel Electric Products, Inc., Buffalo, N.Y.

TAKE A GOOD CLOSE LOOK AT CEM-FIL® AR GLASS FIBER, GLASS REINFORCED CEMENT...

IT'S THE SHAPE OF THINGS TO COME.

GRC (Glass Reinforced Cement) is the building material of the future. And it is here today. In fact, Cem-Fil AR Glass Fiber is the real thing. GRC is a practical reality. It's the first and only fiber extensively field tested and proven airtight, mold and water resistant.

This label is your guarantee of GRC integrity.

It assures that Cem-FIL AR Glass Fiber has been used as the reinforcing agent in the product that bears it. It also implies the highest degree of GRC technology and quality control in the manufacturing process. This label is found only on GRC products incorporating Cem-FIL AR Glass Fiber, available from a growing list of licensed GRC producers.

A Few New GRC Applications:

#1 - Cladding

#2 - Cladding

#3 - Lost Form Work
Large waffle floor pans of GRC were used to form the five floors of this brewery building.

#4 - Interior Decor
GRC ceiling units installed in shopping center. GRC specified in place of plaster for noise and fire resistance.

#5 - Acoustic Hood
GRC molded for use as an acoustic hood for Bellis & Morcome, Ltd. "Commander" GRC pressor.

If you'd like to know more about GRC, its many applications and its availability, write or call:

Cem-FIL® CORPORATION

The All-New 1977 Calendar of Historic Architectural Events

The 1977 Architectural Calendar is better than ever! It is all new, with 365 more historic events in architectural history and 13 more stunning architectural photographs by award-winning architectural photographer G. E. Kidder Smith, FAIA. And, for the first time this year's calendar is designed to be used as a write-in day calendar as well as a wall calendar! They said it couldn't be done, but the 1977 Architectural Calendar continues its daily commemoration of memorable architectural events...famous fires in architecture and engineering...births and deaths of the world's greatest architects and engineers...significant, amusing and little-known facts that inform and surprise even the most knowledgeable...

- The day Palladio was fined for absenteeism from the construction site
- The day the Parthenon was "rediscovered" during the Renaissance
- The day that Latrope complained that architecture wasn't a profession for a gentleman
- The day Michelangelo began painting the Sistine Chapel
- The day Thomas Jefferson insured Monticello—for $6,300
- The day Inigo Jones loaned his client (and King) £500
- The day the Congressional Medal of Honor was awarded to a famous American architect
- The day Disneyland opened

...these and hundreds of other bits of history make the 1977 Architectural Calendar a valuable source of architectural knowledge and a true collector's item.

Illustrated with 13 beautiful, full-color photographs illustrating the architectural heritage of the United States, this calendar will make a handsome and decorative addition to your home or office and make a much-appreciated (and inexpensive) gift. This strikingly designed calendar is printed on luxurious enamel stock in an oversized, 9"x12" format. Only a limited number of calendars are being printed this year, so in order to avoid disappointment, order today! Send your payment for $5.00 to Architectural Record Books, 1221 Avenue of the Americas, 41st Floor, New York, New York 10020, or use the handy order blank below.

The custom sill convectors for your next job are ready

and waiting for you at Markel. Because for the first time, you can specify convectors that have the custom look, but are standard items.

It's called the Markel 4600 series. These artfully designed convectors let you choose a style and size without sacrificing the integrity of your design. At the same time, you're selecting highly efficient convectors that respect the integrity of your client's budget.

The 4600 system is a unique blend of form and function with no compromise to either. You can combine variable heat densities, inactive areas and controls in one monolithic enclosure. Inconspicuous seams permit infinite lengths. A wide selection of configurations allows you to give each area the type and amount of heat required.

Vinyl coated, textured and stainless steel finishes available. Colors can be produced in exact matched shades.

Markel 4600 sill convectors. They're aesthetically pleasing. Have customary low prices. Available when you need them. And are designed so everyone will think they were custom made.

Question: Should an architect have to do the laundry?

Answer: No way. Instead, feel free to call on Econ Systems for everything your client needs in a well-planned, on-premise laundry. You could come out a hero. Because we can often help you point to a 30 to 40 percent cost saving, compared to a contract laundry situation. This represents a continuing operational saving for your client.

We can help you right from the design stage. Or, subject to your wishes, we can do everything: feasibility survey, overall cost and projected savings, preliminary planning, sizing of installation to your available design space, schematic layout, supplying of equipment, and specialty detergents. After the laundry is installed, we back it up with factory-direct service and regular preventive maintenance from our 750 specialists.

So you see—having Econ Systems do your laundry could be just the ticket. Next time, give us a call at our toll free number: 800-238-5557. For a free copy of Econ Systems Engineering and Architectural Specification Manual, write Econ Systems, a division of Economics Laboratory, Inc., 4 Corporate Park Drive, White Plains, New York 10604.

CONCRETE FAILURE

CAUSE

EFFECT

PREVENTION

This magnification shows how rust expands as steel corrodes.

The rusting of ungalvanized reinforcing bar creates a pressure which can crack and spall concrete. Photo A shows a portion of the facade of the Charleston, S.C. Post Office which has been cracked and stained by subsurface rust expanding and "bleeding" through. Photo B shows the underside of a veranda roof in Bermuda where rebar corrosion caused a large section of concrete to fall off.

If you would like to know more about this subject, write on your letterhead for our new booklet: "GALVANIZED REINFORCING BAR—Undercover protection for concrete."

ST. JOE MINERALS CORPORATION
250 Park Avenue
New York, N.Y. 10017

Galvanizing — the metallurgical bonding of zinc into steel — has proven its ability to protect rebar against rust before, during and after installation. This is recognized in the revision of General Services Administration guide specification PBS4-0344.01 as follows: When concrete cover on exterior surfaces is less than 1½ inches... reinforcing bars and mesh shall be zinc coated... in accordance with ASTM A-123.

ZN-640
Space Beautiful

for homes, churches, commercial and institutional structures.

Lock-Deck is a superior laminated decking designed by Potlatch to free the outer limits of your imagination and work with you to make space beautiful in a variety of ways.

The textural qualities and subtle color tones allow the designer to uniquely personalize his plan. A broad range of acrylic stains on wire brush, smooth, or saw textured surfaces are available for your selection.

And, Lock-Deck's strength to weight ratio offers the kind of structural freedom that allows the designer to create imaginative structures as diverse as church and home.

So if you're interested in making space beautiful through free play of the design imagination, contact the Western Wood Products division now.

Coming in mid-May

Architectural Record's
Idea Annual of the Housing Field

RECORD
HOUSES
AND APARTMENTS

In mid-May Architectural Record's Record Houses and Apartments offers a timely opportunity for manufacturers of quality building products to exert year-in and year-out influence on those architects and builders who are at the forefront of the housing market.

It reaches all major groups of specifiers and buyers in this market:

- Some 45,000 architects and engineers—who are verifiably responsible for 87 per cent of the dollar volume of all architect-planned residential building.
- 20,000 of the nation's foremost builders—qualified by Sweet's on the basis of annual building activity to receive the Light Construction Catalog File.
- Some 4,000 leading interior design offices—qualified by Sweet's to receive the Interior Design File.
- In addition, bonus bookstore distribution to an influential segment of the housing building and buying public.

Record Houses and Apartments offers its advertisers a unique advantage:

The issue has the longest working life of any issue of any architectural magazine!
Architects refer to it five, ten, even fifteen years after publication.

Closing date for advertising: April 15
Spectacular Ceiling Patterns, Distinctive Room Dividers, Countless Other uses With New Decorative Acrylic Sheeting.

Lighter than glass, stronger than glass, will not shatter.

Chromo-Flex decorative sheeting is made by an exclusive, patented Glasflex process and is uniquely beautiful, durable, versatile. Drawing on years of specialized experience in acrylic casting, Glasflex technicians perfected this mosaic cast acrylic. In predesigned and custom designed panels, monolithically cast, it is superior to extrusion and calendar sheets.

Chromo-Flex presents an endless horizon of imaginative possibilities to builders, architects, interior decorators and anyone else whose product or services can be helped by striking new decorative effects. Choose from 12 design panels or we will custom design to your needs. Sizes 2' x 2', 2' x 4', 4' x 4'.

Some of Many Chromo-Flex Applications: Ceilings Room Dividers Special Lighting Effects Tub and Shower Enclosures Furniture Decorative Panels Lamp Shades Canopies and Marquees Commercial Displays Stained Glass Windows Company Logos

Advantages of Chromo-Flex: Color-fast Easily workable. Can be: Thermoformed, sawed, machined, drilled, shaved, milled, cemented, butt welded. Use anywhere glass or wood is used. Stained glass effect at substantially lower cost.

Kawneer Thermal Barrier Products

Thermal integrity for a changing world

Today's building will live its life in a different world. Life costing rather than initial construction economies become a primary concern. This means that thermal considerations must receive more and more emphasis in architectural design. Building materials will need to be an integral part of interior climate systems.

To conserve our energy resources, the designer must look beyond conventional building materials and solutions in order to achieve thermal integrity. For example, curtainwall designs, the aluminum glass-holding members themselves can make a vital contribution to thermal efficiency.

Kawneer pioneered the positive thermal break concept in windows and wall systems. By providing a thermal barrier, contact between inside and outside is eliminated. Heat transfer to the outside during cold months and into the building during hot months is minimized. Result: Expenditure for heating and air conditioning is reduced and energy is conserved. And, by offering an extensive line of thermal barrier products, Kawneer is able to give you a great degree of design latitude, providing thermal integrity without esthetic compromise.

All of these innovative products are covered in the Thermal Products section of Sweets Architectural File. Or, write for our new book, Kawneer Thermal Barrier Products, Kawneer Architectural Products, Dept. C, 1105 North Front Street, Niles, Michigan 49120.

For more data, circle 81 on inquiry card.
1602 J.G. Thermal Curtainwall — choose from a wide variety of thermal curtainwall systems for high-rise buildings and framing systems for storefront and low-rise applications.

SM 350T Thermal Framing — The patented seamless coupling mullion feature on this product provides a unitized framing system with unbroken sight lines.
Don’t Let Your
Clients Accept
Substitute Docklevelers

With today’s high labor costs and safety emphasis you design loading docks to include permanent docklevelers. Facts prove they can easily pay for themselves in one year.

However, to assure maximum return on investment, specify genuine Kelley Docklevelers of the right type, size and capacity. Docklevelers with patented automatic safety features and a predictable life span to stand-up to high volume use year-after-year. Choose hydraulic or mechanical, standard heavy duty or extra-heavy duty models. Kelley Docklevelers cost about the same, or even less. So there’s no reason to accept substitutes. Get the complete facts from your Kelley Representative or contact:

The Guaranteed Coping Cover System

We guarantee our PERMASNAP COPING COVER SYSTEM against water leakage. Period. The secret is a styrene gutter chair at each joint that quietly carries water away.

We also make sure the system stays in place. Without expensive wood nailing or imbedded anchor bolts. A special adhesive replaces them. And it sticks against 60 lbs. per square foot of uplift.

Permasnap Coping Covers are also simple to install. (It has to do with the “snap” in the name, but it’s simpler if you see it for yourself.)

All in all, it’s a pretty simple system. Only three parts. And we guarantee all of them. Specify Hickman.

Keep the fiddler off your roof with Hickman.

HICKMAN ALUMINUM CONSTRUCTION PRODUCTS
W. P. Hickman Company  □  175 Sweeten Creek Road

ASHRAE 90-75
ENERGY GUIDELINES.

The new Lennox DSS1 system lets you design your own single zone
VAV package to surpass ASHRAE 90-75 energy guidelines. The
DSS1 offers extraordinary flexibility... efficient operation and
service... exceptional energy savings... and consequent
cost savings.

Here are a few of the many DSS1 options that give you the
right size, right energy, right cost for your application:

- 25 to 45 tons cooling; up to 950,000 Btu/h heating.
- Two-speed, first stage compressor saves energy.
- Heat recovery package (allows recovery of heat from refrigeration
  in supermarkets and restaurants; controls humidity without losing heat).
- Power Saver™ package (allows use of outdoor air for cooling).
- Power Saver II™ (allows recovery of heat from lighting).
- Latent Load Discriminator™ (increases partial-load EER up to 30%).
- Heat pump options available soon.
- Solid state, energy-saving control system.

For complete information, see your Lennox Territory Manager. Or write:
Lennox Industries Inc., 760 South 12th Avenue, Marshalltown, Iowa 50158.

Nifty problem-solving ideas from Lennox.

MODULAR CONVENIENCE
THAT'S MORE THAN SKIN DEEP
MEDICAL WALLS AND CONSOLES
FROM SQUARE D

ECONOMICAL WALLS...
Beneath the durable and attractive vinyl-clad steel surface of each general care patient wall from Square D Company lie two significant economies. First, there's the unusually high quality we can offer at unusually competitive prices—thanks to the latest manufacturing techniques. And second, each modular wall is completely piped and wired at the factory to meet all existing codes. Which means they can be installed in hours instead of days.

And as for the skin, Square D medical walls are available in a variety of finishes to suit your new construction or remodeling designs.

...AND EFFICIENT CONSOLES
Square D consoles efficiently arrange vital patient care services in a compact panel that's attractive and easy to use. In addition to outlets for medical air, vacuum and oxygen, Square D consoles can accommodate various arrays of patient nurse calls, monitoring jacks, power receptacles, QWIK-GARD® ground fault receptacles, etc. All according to your specifications.

Square D also offers sturdy bed bumpers that protect walls and delicate equipment from damage when the bed is moved.

There's more to Square D patient care systems than meets the eye. To find out more about them, contact your nearby Square D field office. Or write us: Square D Company, Dept. SA, 3300 Medalist Drive, Oshkosh, WI 54901. (414) 426-1330

VONAR interliner kept one of the chairs from burning up in this limited ignition fire.

This test dramatically illustrates that VONAR® 3 interliner can reduce the likelihood of ignition of upholstered furniture as a unit. Should ignition occur, it can reduce the burning rate of upholstered furniture in limited ignition situations.

Ten minutes, thirty seconds before this photo was taken, these two office chairs were identical in every way but one. Same construction, cushioning foam and upholstery fabric. Both good looking and comfortable.

But the nylon fabric on the chair on the right had been backcoated with VONAR 3 interliner at a modest additional cost.

The test began with identical wastepaper fires in the baskets under the two seats. After one and one-half minutes, the fabric on both chairs was ignited. After four minutes, the paper fires were out, but the chair without VONAR continued to burn until completely consumed.

The chair with VONAR 3 did not. As the flames heated the VONAR interliner, it released heat-absorbing water vapor and a flame retardant. As the VONAR absorbed heat, it formed a rigid, insulating char layer on the chair parts in contact with the ignition source. The maximum contribution obtainable from VONAR interliners occurs when VONAR totally envelopes flammable cushioning materials. If VONAR interliners are ripped or cut, their degree of protection is diminished. For that reason, VONAR is not recommended for seating areas where there is concern about vandalism or intentional fire.

Let us help you determine what a difference VONAR can make in your furniture or in your future specifications. Use the coupon or write: Du Pont Co., Room 25337A, Wilmington, DE 19898.

Mail to: Du Pont Company, Room 25337A, Wilmington, DE 19898.
Please send me:

Glasbord ribbed panels help your refrigerators refrigerate.

...foodstuffs stay fresher

Glasbord ribbed panels on your cooler walls allow free flow of cold air around tightly stacked boxes, bins, and cartons. Foodstuffs stay fresher, spoilage is reduced, profits go up.

Glasbord ribbed panels are a tough, durable fiber glass reinforced plastic (frp) lining material, compression molded with protruding ribs to assure maximum air circulation at wall areas. "Hot spots" that encourage spoilage are eliminated. Panels are nonporous, stain resistant, USDA accepted.

Learn how Glasbord ribbed panels can help your refrigerators refrigerate. Get the full story today.

PLEASE WRITE FOR COMPLETE INFORMATION
TCS...THE LOGIC OF ITS USE

Rarely if ever has metal roofing been employed with more stunning visual impact than on Robin Hood Dell West, the Philadelphia Orchestra’s new summer home, which will also serve as a creative center for other groups in the performing arts.

In specifying over 80,000 square feet of TCS (Terne-Coated Stainless Steel) on this exciting structure, the architects were primarily influenced by several practical as well as aesthetic considerations. Among them was the material’s unsurpassed durability which is measured in generations rather than years. They were also aware that TCS weathers naturally to a uniform and attractive warm gray; that, properly installed, it will never need maintenance; and that it is highly resistant to even the most severe corrosive attack.

The steel-framed, long-span system: a natural choice for five new Florida parking garages.

Five new open-deck parking garages, accommodating up to 3,402 cars, are serving Florida’s state employees in Capitol Center—a complex of government offices in Tallahassee.

The steel-framed, long-span concept was chosen over competitive systems for reasons combining economy, construction speed and aesthetics.

From the start, sites were selected and the respective structures designed with every intention of preserving visual harmony with the existing buildings and landscaping of Capitol Center. The happy result of this careful planning is that most of the trees are still there!

THE GREATEST ECONOMY

As many as eight different structural systems were used as models for evaluation. This in-depth study, which examined construction speed as well as material costs, showed that structural steel framing with composite cast-in-place concrete decks had the potential for the greatest economy.

The decision proved wise. Construction cost per car is figured at approximately $2,400—a unit cost substantially lower than comparable facilities in Florida.

NO FIRE PROTECTIVE MATERIALS NEEDED!

One of the decisive elements in setting up the low-cost estimate for the steel-framing system was the fact that the steel structures could be left exposed and unprotected—except for painting.

Changes in the regulations of a number of building codes (and fire insurance rates) have been effected through a research project carried out at Scranton, Pa., under the auspices of the American Iron and Steel Institute. The dramatic and fully documented Scranton Fire Test was an actual auto burnout in a normally occupied open-deck public parking garage. It confirmed the results of previous tests: an automobile fire in these structures is a low-hazard fire.

STANDARD MODULE

For all the five facilities (named Alpha, Beta, Gamma, Delta and Epsilon) the designers selected a standard bay module, which proved to be a major factor in cost-cutting.

Each bay measures 55-ft. wide with a 20-ft. distance between columns and a floor-to-floor height of 10-ft. These dimensions allow angle (58 degrees) parking for standard-size cars and perpendicular parking for compact cars.

Self-parking is, of course, made easier by this amount of long-span, column-free space.

3,446 tons of ASTM A36 steel went into the five facilities which, together, have a floor area of 1,074,909 sq. ft. Only two column sizes were used throughout: W10 x 49 and W10 x 72.

All beams are W24’s with the majority weighing 68 lbs. per linear foot. Design loads are 50 psf for roofs and floors.

United States Steel is ready to help you with your design of a long-span, open-deck garage. For a Structural Report on the Capitol Center Parking Garages, and for further information, write to U.S. Steel, P.O. Box 86 (G614), Pittsburgh, Pa. 15230. Or contact a USS Construction Representative through your nearest USS Sales office.

United States Steel
A $35,000,000 medical center in Mississippi.

ELEVATORS BY DOVER

The new Mississippi Baptist Medical Center in Jackson puts a $22,000,000 building and $13,000,000 worth of health-care equipment at the service of residents of the area. The 600-bed facility includes 19 operating rooms, a coronary care unit, a burn unit, and a step-down unit for recuperative care. Supply and food carts circulate throughout the building 24 hours a day on five computerized Dover cart lifts. These special elevators dispatch and deliver the carts automatically to patient floors. Passenger and service traffic is smoothly handled by eight Dover Traction Elevators and one Dover Olddraulic Elevator. For more information on Dover Elevators and Dover's special lifts and dumb waiters for hospital use, write Dover Corporation, Elevator Division, Dept. A, P.O. Box 2177, Memphis, Tenn. In Canada: Dover/Turnbull.

The "Phantom" Passes Unnoticed... Until You Need Him.

When you need a sprinkler system that answers construction and aesthetic standards, "The Phantom" is your answer! Once installed, you'll hardly ever notice him—hidden behind a flush plate that blends with practically any ceiling. But if fire threatens, he strikes back... fast! Within seconds, the plate falls away, "The Phantom" pops down, and fights back. Reliability and performance that won't give failure a ghost of a chance. So when your project calls for a sprinkler system that's architecturally sensitive, just remember "The Phantom." You'll find him discreet and effective, beyond a shadow of a doubt.
In Houston's Famous "The Galleria" Skyline

Five Ceco formwork jobs in eight years

Contractors and owners coast to coast save on forming costs with Ceco services

Impressive architecture in concrete is adding excitement to Houston's modern, Galleria skyline. These five projects are typical of Ceco's concrete formwork in Houston over the past eight years.

With Ceco services you get simplicity, speed and reliability.

— And a firm contract price that represents cost savings to contractors and project owners.

— And performance by formwork specialists who take pride in getting the job done right.

Ceco offers economical and time-saving formwork for rib-slabs, waffle-slabs, flat-slabs, columns and beams. Services are nationwide on a local basis. For more facts, please see Sweet's or contact your nearest Ceco office.

THREE QUESTIONS TO ASK BEFORE YOU BUY A COLOR FENCE.

1. Are all fence components zinc-coated under the color coating? USS CYCLONE fence is—so if the coating gets damaged, your fence is still protected against corrosion. 2. Are the posts, rails, and terminal posts all roll-formed, so they're self-draining? CYCLONE line posts, for instance, are C-shaped. They're almost 25% stronger than the pipe usually supplied—and water can't collect to corrode from inside. 3. Who will install your fence? We install all CYCLONE fence with expert crews. We take the headaches and responsibility, not you. CYCLONE fence comes in two colors: green, to blend with the landscape. Or black (that seems to "disappear"). We think our color fence will look better, last longer, and take less maintenance than any other chain link fence. Ask for sample specifications. Look for CYCLONE in the Yellow Pages. Or write Dan Hoover, U.S. Steel Supply, 13535 S. Torrence Ave., Chicago, Ill. 60633.

New Design Guide for Textured Structural Tile

Behind the distinguished Vari-Tran® coated glass walls of Tower Place lies a building with a frugal personality. A personality which has proved to the owners that spending a little more for glass can save a lot of money and energy in the long run.

Check the figures in the chart. Choosing Vari-Tran coated glass in Thermopane® insulating units, the owners spent 55% more than the base comparison glass, 1” Grey Thermopane. But look at the numbers right down the line from the money saved on heating, cooling, and distribution equipment to the impressive savings on annual operating costs.

We want you to know the energy and dollar savings LOF high performance glass can mean for your clients. Contact one of our architectural representatives. He'll be glad to put our computers to work on a spec sheet for a building you have in the works.

For more detailed information on LOF glass products, please refer to LOF's Sweet's Catalog—"Glass for Construction." Or you can write Marty Wenzler at Libbey-Owens-Ford Company, 811 Madison Avenue, Toledo, Ohio 43695.

Gives you hundreds of innovative, profitable ideas for buildings and facilities for leisure pursuits

PLACES FOR PEOPLE

Hotels • Motels • Restaurants • Bars • Clubs • Community Recreation Facilities • Camps • Parks • Plazas • Playgrounds

Edited by
JEANNE M. DAVERN, Hon. AIA

244 pages • 345 photographs • 234 drawings and floor plans • 9 x 12 format • $19.50

An Architectural Record Book

BURSTING WITH PHOTOGRAPHS and plans of some of the best contemporary architecture, PLACES FOR PEOPLE reports on the latest trends in facilities for public accommodations and leisure-time activities. Lavishly illustrated case studies provide compact surveys of each building or facility, its purpose, and the architect's solutions to the problems he or she faced.

Hotels and motels to enjoy and remember
The first section shows how 28 outstanding recent hostelries were provided with a special identity by their often highly original architecture. From San Francisco's Hyatt Regency Hotel to Nashville's King of the Road Motor Inn to the Flaine ski resort near Chamonix, France, the book examines every aspect of these buildings—site positioning, lobbies, room layouts, interior decoration, furnishings—to show how accommodations were created that people enjoy and remember.

Restaurants and clubs that "pull in" business
In the next section on restaurants, bars, country clubs, and golf and tennis clubs, 16 case studies guide you through every aspect of the planning problems of these types of facilities. Ranging from Clyde's Bar, Washington, D.C. to the East Hampton, L.I. Tennis Club, you will see some extraordinary examples of successful design in an area where there is an amazing relationship between good design and good business.

New directions in recreational facilities
The final section provides a fascinating report on some truly innovative facilities for community recreation now being developed across the country. Ranging from the Camp Lane Sleeping Shelters near Mapleton, Ore. to New York City's Inwood Hill Park Nature Trails, these 16 facilities were also all carefully planned to minimize their impact on the environment.

Articles by leading authorities
Articles by leading authorities guide you through the planning considerations for successful resort hotels and for efficient "back-of-the-house" service areas that result in smoothly running motels and hotels. A special report explores Hawaii's imaginative response to the need for long-range planning for the preservation and enjoyment of the state's natural wonders. Based on recent articles from Architectural Record, PLACES FOR PEOPLE is a sequel to the best-selling Architectural Record Book of the same title, Motels, Hotels, Restaurants and Bars, now out of print.

FENESTRA THERMAL Barrier STEEL DOORS

featuring

U Factors to 0.33

Complete Line of THERMAL Barrier Doors . . . One For Your Application

Fenestra's energy conserving Thermal Barrier Door line is the answer for exterior door applications where extreme cold or heat are factors affecting interior comfort . . . or for interior door applications where cold or heat are to be isolated in a given area.

While the U Factor of Fenestra's standard stock doors meets requirements of the Steel Door Institute, now there is a complete line of doors to suit your U Factor specification requirements . . . Fenestra Thermal Barrier Doors. Using various insulating materials, some unique to Fenestra, U Factors are available as low as 0.33. Full size doors were tested by a nationally known independent testing laboratory . . . tests were not merely on core materials or small sections of doors.

These superior doors are designed for use in Northern tier cold climates, Southern temperate climates, Federal construction projects, for motel corridor use . . . all applications where conservation of heat or cold are indicated.

Thermal Barrier Doors maintain the excellent security and fire label construction characteristics so long associated with Fenestra standard steel doors.

Ask your authorized Fenestra distributor about Fenestra's Thermal Barrier Doors. Remember . . . U Factors to 0.33.

Features —

- Excellent thermal properties
- Conserve energy
- Fire label construction
- Maximum security
- Full scale doors tested by Independent Test Laboratory

Designed for —

- Northern tier climates
- Southern temperate climates
- Federal construction projects
- Motel corridors

FENESTRA — Erie, Pennsylvania 16505
We are interested in your line of Thermal Barrier Steel Doors

You can spend a little for Envelope Energy Saver now. Or a lot more for fuel later.

There is a better way to insulate today’s (and yesterday’s) buildings for tomorrow’s lower energy availability and higher energy cost. Use CertainTeed’s fiber glass wall and panel Envelope Energy Saver (EES) insulation. It’s today’s best balance of high thermal efficiency and low installed cost.

EES is noncombustible, meets ASTM E136 requirements and UL Standard Tunnel Test ASTM E84. It’s dimensionally stable and unaffected by moisture.

CertainTeed EES will deliver “U” factors as low as .05 (“R” of 17) in single 4-inch thickness, depending on design and energy savings criteria. But whether your wall is block, metal or brick, there’s an EES insulation to fit right in.

There’s also an EES insulation for retrofit in existing buildings. It’s used in conjunction with a low cost “Z” stud system. Just pop “Z” channels on the existing interior wall, add EES insulation, and finish off with foil-backed gypsum board. The result: a low-cost, well insulated wall, realistic fuel bills, and a neat, new interior finish.

Send for our new wall design manual, “Wall & Panel Envelope Insulations,” or look us up in Sweets. It has all the “U” and “R” factors you need for 5 different wall types, from spandrel to precast, plus ways to calculate insulation cost payback.

Remember, insulation today will make your buildings affordable tomorrow. Insulation Group, CertainTeed Corporation, Box 860, Valley Forge, PA 19482.

Pictured is the GSA Building where 3½” thickness of EES Insulation was used to meet a “U” of .06 (“R” of 16) design requirement and non-combustible criteria.

Manufacturers of energy saving fiber glass insulation for buildings, piping, equipment, ducts and fiber glass duct systems.

Add a "stimulating dimension" to your understanding of architecture

DIMENSIONS:
Space, shape & scale in architecture
Charles Moore, FAIA, and Gerald Allen

"Remarkably fresh... I hope the book will be widely read, as it should be."
—Cesar Pelli, AIA
Dean, Yale School of Architecture

"Refreshing reading"
—Dr. Rosemarie Haag Bletter
Columbia University

"An important contribution... and literate... I admire it enormously."
—Robert A. M. Stern, AIA

"Essential reading for contemporary architects"
—Hugh Hardy, FAIA

192 pp., 6x9", illustrations

Two of America's most outstanding architect-authors show that the dimensions of architecture are not just the familiar ones of height, width and depth, but actually include a host of variables which affect the ways we experience our built environment. In concise opening essays they give clear and concise definitions of space, shape and scale in architecture, and then, in a series of architectural "walking tours" show how these concepts are applied—and misapplied—in the man-made world.

This is not just another architecture book promoting current fads or promoting philosophical "isms," but rather is a call back to the basic human and social goals which the authors see as unchanged throughout time: making places that people can inhabit with both their bodies and their minds, places that respond to all of the human dimensions.

Contents include... Dimensions... Space... Shape... Scale... St. Thomas Church: Serving two spaces... Action Architecture: The Santa Barbara County Courthouse and LeCorbusier's Carpenter Center... Inclusive and Exclusive... The Minneapolis Federal Reserve Bank: Looking in the gift horse's mouth... Two Buildings by Joseph Esherick: Dedicated to the moving inhabitant, not the maker of form... Hadrian's Villa: A whole world in a circle and a square... Likenesses... You Have to Pay for the Public Life... Discrimination in Housing Design... Southernness: A regional dimension... Modesty: If it's not the end, it's certainly the beginning... Schindler and Richardson... Envoy

Moore and Allen encourage a fresh thought and a freshness of insight that makes this book only a starting point in raising your own consciousness of architecture. Lavishly illustrated with hundreds of beautiful and thought-provoking photographs, this is one architecture book that will continue to be of value through the years.

To order your copy, send your payment for $12.95 to Architectural Record Books, 1221 Avenue of the Americas, 41st Floor, New York, N.Y. 10020, or use the coupon below.

Dimensions is the most significant book on the past, the present and the future of architecture to appear in some time. Continuing the same concerns they discussed in their earlier, critically-acclaimed book The Place of Houses,
Right choice for rough conditions.

A Bradley stainless steel Washfountain seems to last forever, because stainless shrugs off most of the things that make a washfixture show its age. Corrosion, grit, chemicals, tough industrial elements and physical abuse can be a maintenance headache. But rugged stainless steel Washfountains keep on working, and looking good. The choice of those who need the very best.

Bradley Washfountains make washroom dollars work harder, too. Washfountains cut installation costs, produce significant water and energy cost savings, and save floor space and maintenance costs. Write for our WASHROOM/SHOWER ROOM PLANNING GUIDE. Bradley Corporation, 9101 Fountain Boulevard, Menomonee Falls, WI 53051.

Another right idea from Bradley
Searching with Sweet's is twice as fast.
And immeasurably less frustrating.

In a major design firm, a timed test was held—one person using Sweet's, another using other sources to find specs for the same products.

Sweet's got the job done twice as fast. That's because Sweet's carries over 10,000 products all neatly classified and triple-indexed by firm, by product, and by trade name.

And you can always find Sweet's. Because they're so fat with information, it's not likely Sweet's will be mislaid, misfiled, left at job sites, or squirreled away in somebody's private files.

Maybe the most significant result of the test was the fact that many product alogs couldn't be located in the office at all without turning to Sweet's.

And there's nothing more frustrating than searching twice as long and coming up with nothing.

So Sweet's doesn't just save you time. Sweet's can also save you a lot of aggravation.

Sweet's. You can't beat The System.

The Sweet's System: Details on over 10,000 products from over 1,400 manufacturers • Instant information retrieval through triple indexing by product, trade name and firm name • GuideLines® Organization, the AIA-endorsed method for developing product information for specifiers and buyers • Yearly updating to keep data current • BUYLINE 800®, the fastest way to locate reps.
EVERYONE'S AHEAD BEHIND AN AMARLITE CURTAIN WALL.

The Architect is ahead because, by specifying Amarlite curtain walls to be combined with environmental glass, he has made the professionals on the Amarlite Anaconda curtain wall team available to assist him from conception to conclusion of the project. And in addition, he has provided his client with a building of thermally improved excellence, without compromising his own esthetics.

The Owner is ahead because the Amarlite Anaconda curtain wall team has helped with cost studies, bidding, engineering and even installation, and because Amarlite's thermally improved curtain walls cut down on air conditioning and heating needs, which can mean far less cost up front.

The Manager is ahead because the Amarlite thermally improved curtain walls, designed to prevent heat transfer, keep the building evenly comfortable. Which means they reduce day-to-day heating and cooling operating costs, reduce interior climate system adjustments, and reduce tenant complaints to a bare minimum.

The Tenants are ahead because they're totally comfortable. Warm all winter and cool all summer since Amarlite's continuous thermal spacers isolate the curtain wall from interior to exterior, providing a highly efficient thermal barrier.

So if your project calls for architectural aluminum that meets the demands of today's market—anything from curtain walls to storefronts and Safetyline™ doors—pick up the phone and call Amarlite Anaconda.

Then you, too, will be ahead.
street light planning made easy

Whether for an entire city or one small plaza... Welsbach helps take the confusion, uncertainty, risk and red tape out of the selection and installation of classical street light fixtures and posts.

For 100 years Welsbach has been a leader in providing highest quality street lighting products and services coast-to-coast. Professional urban designers, municipal planners and private developers all have come to depend on our comprehensive design, engineering and manufacturing experience.

Write for free 24-page catalog.

Welsbach Lighting Products Company, Inc.
240 Sargent Drive
New Haven, Conn. 06511
A Welsbach Company
You can't ignore the reasons for automating your hospital's doors. Speed, conditioned air, safety, fire control, many more. Such reasons, sooner or later, must lead you to Stanley. After all, no other maker can offer you so many design options or promise you so much trouble-free service. Stanley, of course, means the Stanley Magic-Door® people — the originators and world's foremost makers of quality automated doors. Stanley Door Operating Equipment, Division of The Stanley Works, Farmington, CT 06032.
"Quality elevators make a good impression. That's why I like working with Otis."

"We've had the best two years in our history in the two worst years of the economy," states builder-developer Howard Peterson. To back up his claim, the 26 offices and warehouses in his Castleton Commercial Park, located 15 miles from Indianapolis, Indiana, are 100 percent occupied.

Mr. Peterson bought his first Otis elevator when he built the first building at Castleton Park 10 years ago. "The name of the game is to attract good tenants in the first place, treat them right and keep them," he says. "When you have a quality lobby with quality elevators it makes a good impression. That's why I like working with Otis."

There are nine Otis pre-engineered hydraulic elevators with 1500 and 4000-pound capacities, and a pair of gearless elevators in the 5-story headquarters building at Castleton. Mr. Petersen is currently building another of the 8-story office buildings and a warehouse, built "the finest in the Midwest" on the drawing boards. An 8-story office building is also planned for the future.

The elevators will be Otis because Mr. Peterson said, "We had good service with the first one, so we've stuck with them. They have a quality product."

When you want the best, you want

OTIS ELEVATOR COMPANY

REQUIRED READING FOR PROFESSIONALS FROM ARCHITECTURAL RECORD BOOKS...

DIMENSIONS
Space, Shape & Scale in Architecture
Charles Moore, FAIA, & Gerald Allen
Two of America's most respected architects-authors define the dimensions of architecture with clarity and simplicity and show how they are applied (and sometimes misapplied) in the man-made world. A provocative, intellectually stimulating book on the true goals of architecture.
$12.95

SPACE PLANNING
Designing the Office Environment
Lila Shoshkes
This, the most up-to-date survey of office design techniques, is written for both designers and clients alike. All aspects of the design process are discussed in depth, and provide a state-of-the-art overview of the subject, based on the author's on-the-job experience.
$17.50

RECENT TECHNIQUES IN ARCHITECTURAL PRACTICE
Herbert Class, AIA
With the sponsorship of the AIA, this valuable reference contains chapters on every aspect of architectural office and business management techniques written by acknowledged authorities in each field. An authoritative and indispensable guide for every office.
$25.00

PROFESSIONAL CONSTRUCTION MANAGEMENT AND PROJECT ADMINISTRATION
William B. Foxhall
This second edition of an already standard work is an invaluable basic tool to understanding the booming area of construction management. Essential information for any architect who wants to get a foothold in this rapidly-growing market.
$17.50

IN THE CAUSE OF ARCHITECTURE
Frank Lloyd Wright
Wright's historic essays for Architectural Record are collected together for the first time in this handsome, lavishly illustrated volume. The genius of America's greatest architect touches every page of what is truly an architecture book for all seasons.
$17.50

ARCHITECTURE AS A HOME FOR MAN
Lewis Mumford
America's foremost architectural critic and social philosopher discusses the crucial questions of architecture, planning, and the environment in this collection of essays that span 50 years of his career as the leading spokesman for a more humane world.
$15.00

MUNN DESIGN AS PUBLIC POLICY
Jonathan Barnett, AIA
A practical and concise book shows how planners, architects, engineers, designers and others can work with private and public sectors in their own cities to achieve a successful urban design methodology that produces results.
$15.00

ARCHITECTURE OBSERVED
Alan Dunn
Laugh lines by America's foremost cartoon critic! A joyous collection that punctures the foibles and pretensions of the architectural profession and its practitioners. This award-winning volume makes a sophisticated and inexpensive gift idea.
$6.95

THE ARCHITECTURAL COOKBOOK
Arthur Hawkins
A cookbook especially for architects, engineers and contractors, these 200 recipes are as enjoyable for their names as for their contents. Cooking will never be the same after Franks Lloyd Wright, Cui-de-Snack, F. W. Dodge-odge, Chili Kahn Carne, Raisin Fees and more!
$4.95

a new dimension in creative flooring design...

Newly beautiful. Newly practical. Newly available in the United States. That's NORAMENT...the exciting new 100% synthetic rubber floor covering that combines exceptional visual appeal with unique wear and safety features. The proportionate design of the pastilles, available in both high and low profiles, gives the 1-meter-square (39.37 inches square) units a distinctive appearance. These large sections mean fewer joints than are required with smaller squares. This is an important cleanliness factor, particularly in hospitals. A selection of rich colors can be adapted to your client's preferences. And this design flexibility is just one of the advantages that make NORAMENT ideal for indoor and outdoor use. It's also extremely wear-resistant...with a slip-resistant surface that's antistatic, chemical-resistant, quiet, fire-safe and easy to maintain. Because NORAMENT is synthetic it does not have the odor associated with claimed rubber. A color-matched joint sealing compound for use in wet areas and for special conditions, and a complete line of color-coordinated trim moldings are available. Already used on some of the world's finest architectural projects, this handsome flooring is now being used and tested in some of this country's most innovative buildings. Write for samples and complete details on NORAMENT...the beautiful new way to express your design ideas.

Metal Roofing
by ColorKlad
Outperforms All Other Roofing Material!

Alexander Ramsey Senior High
School, Architect: Thorsen & Thorsen
Associates, Inc.

Sears Imported Autos, Kornliebel/Larsen
Associates, Inc.

Whichever the size of your metal roofing project, specify the durability, beauty and economy of ColorKlad available in any quantity from 1 sheet to 1 million. ColorKlad's written 20 year warranty, unequalled in our industry, guarantees color retention and durability. Nine active colors, two textures, and various sheet sizes give the architect extraordinary latitude of design. ColorKlad steel has the strength plus coefficients of expansion and contraction to limit the use of wider panels, thus eliminating waviness and oil canning found in lesser metals. ColorKlad's high integrity is economical too! Cost is generally 2/3 that of copper and usually 1/3 less than zinc clad metals, soft stainless steel or copper clad steel.

ColorKlad. Your best metal roofing choice—no matter what size the project.

now...meet
smoke
regulations

with special
VPI
solid vinyl tile

VPI’s popular Vinylast® and Terralast® patterns are now available in special smoke retardant formulations to meet local building codes, as well as fire safety regulations for federally funded health care facilities.

Independent laboratory tests conducted in accordance with Appendix II, NBS Technical Notes 708, show smoke generation ratings of less than 450. In addition, flame spread ratings are less than 75 when tested according to ASTM E-84. Both patterns are offered on special order in the same 10 colors as regular Vinylast and Terralast.

rely on VPI quality

Like all VPI solid vinyl tile, smoke retardant Vinylast and Terralast are quiet and comfortable under foot, have excellent indentation recovery, and are resistant to most chemicals. Each tile is Micro-squared™ for virtually seamless installation.

The pattern extends through the entire thickness, so it can’t wear off for the life of the tile. Installation with VPI “dead-set” adhesive ensures a positive bond, with no lateral movement or shrinkage. Write today for details.

Beautiful Alternatives to Glare

The Pericline Optical System eliminates harsh, vision destroying glare from the luminaire — yet, in actual comparison, outperforms other luminaire systems in its broad distribution of effective illumination on the ground. The result is evenly lighted environments with exceptional visual comfort plus the highest degree of energy efficiency available today.

As examples of this unmatched performance, the Moldcast® Pericline system provides up to 60%* more "square feet of illumination per watt" than the best box-shaped "cutoff" luminaires and over 30% more than the harsh glare-producing "Cobra-head". This efficiency allows wider pole spacings, fewer luminaires and lower power consumption.

The patented Pericline system is available in contemporary and traditional luminaire styles each with a unique, softly illuminated appearance which makes them as beautiful at night as in the day. Models are available for pole and wall mounting in a wide range of sizes and finishes from 1000 watts HID for large area lighting to 70 watts HID for below-eye-level "Bollard" units.

If you want the pleasant, human appearance of a gaslight luminaire . . . yet, need the most efficient illumination available today, there is no substitute for the Moldcast Pericline Optical System.

For your next new project or restoration, contact us for lighting recommendations and efficiency comparisons. Write: Moldcast Lighting, Interstate 80 at Maple Avenue, Pine Brook, New Jersey 07058. In Canada: VARCO Industries, Ltd., Dorval, Quebec H9P 2N4.

* Based on minimum foot-candles required.
Why choose COLONIST®
by Masonite Corporation?

Detail
Colonist is the only die-formed door with the carefully executed wealth of detail that exactly duplicates the appearance and character of wood stile and rail doors. Cove and bead sticking, grain and joint details... all are sharp, clear and realistic. Thus, only Colonist does what a die-formed door should do: look like the real thing.

Durability
Colonist is not like a wooden door in one respect: Colonist is tougher. Since it's die-formed from a single sheet of hardboard (which is 50% denser than wood), there are no joints between the stile, moldings, panels and rails to separate through hard use or with the passage of time. So Colonist is in fact better than the wood door it replaces.

Price
Despite these superior features, Colonist faced doors sell for less than half the price of wood stile and rail doors and only a little bit more than less authentic die-formed doors. So any way you look at it, with quality in mind... choose Colonist.

For the names of quality door manufacturers using Colonist, write: Masonite Corporation, 29 North Wacker Drive, Chicago, Illinois 60606.

Colonist and Masonite are registered trademarks of Masonite Corporation.
You waste a lot of water when you use flush tanks instead of Sloan Flush Valves.

Figure it out for yourself.

<table>
<thead>
<tr>
<th>Number of tank toilets in your building</th>
<th>Number of gallons a Sloan Flush Valve saves compared to a flush tank</th>
<th>Total number of gallons wasted by flush tanks on every flush</th>
<th>Plus the number of gallons wasted by unnoticed leaks</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>x 0.64</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

No matter what figure you got, remember it’s only for a single flush. Think of how many times all the toilets in your building are flushed every day. Every month. And since every Sloan Flush Valve uses 0.64 gallon less than a flush tank, think of how much water you could be saving, instead of wasting. What’s more, a Sloan Flush Valve saves you money by using this same minimum water volume with every flush. No more, no less. That’s because it completes its cycle, then shuts off automatically. Again, there’s less water wasted and a lower water bill. Remember, it takes energy to pump water. The less water you have to pump, the less energy you have to pay for.

So stop wasting water and start saving money. To tell you how, we’d like you to have the test report from an independent laboratory that proves Sloan Flush Valves use 0.64 of a gallon less than tanks. For your free copy, just write to us.

Sloan Flush Valves.

Anything else is a waste of money.

SLOAN VALVE COMPANY
10600 SEYMOUR • FRANKLIN PARK, ILL. 60131
